

# Detection of Contact List, Detection Strategy DET0679

Archived: 2026-04-05 13:08:11 UTC

## AN1782

Application vetting services could look for `android.permission.READ_CONTACTS` in an Android application's manifest, or `NSContactsUsageDescription` in an iOS application's `Info.plist` file. Most applications do not need contact list access, so extra scrutiny could be applied to those that request it.

On both Android and iOS, the user can manage which applications have permission to access the contact list through the device settings screen, revoking the permission if necessary.
