[\\_\\_AbsoluteTimerInstruction](#) Causes an event to be generated on a specific date at a specific time. [\\_\\_ACE](#) Represents an access control entry (ACE). [\\_\\_AggregateEvent](#) Represents an aggregate event of several individual intrinsic or extrinsic events. [\\_\\_ArbitratorConfiguration](#) Configuration class that limits the internal resources that are used by operations initiated by WMI clients. [\\_\\_CacheControl](#) Determines when WMI should release a Component Object Model (COM) object. [\\_\\_CIMOMIdentification](#) Describes the local installation of WMI. [\\_\\_ClassCreationEvent](#) Represents a class creation event, which is a type of [intrinsic event](#) generated when a new class is added to the namespace. [\\_\\_ClassDeletionEvent](#) Represents a class deletion event, which is a type of [intrinsic event](#) generated when a class is removed from the namespace. [\\_\\_ClassModificationEvent](#) Represents a class modification event, which is a type of [intrinsic event](#) generated when a class is changed in the namespace. [\\_\\_ClassOperationEvent](#) A base class for all intrinsic events that relate to a class. [\\_\\_ClassProviderRegistration](#) Registers class providers in WMI. [\\_\\_ConsumerFailureEvent](#) Represents the occurrence of some other event that is being dropped because of the failure of an event consumer. [\\_\\_Event](#) An abstract base class that serves as the parent class for all intrinsic and extrinsic events. [\\_\\_EventConsumer](#) An abstract base class that is used in the registration of a permanent event consumer. [\\_\\_EventConsumerProviderCacheControl](#) Determines when WMI should release an event consumer provider. [\\_\\_EventConsumerProviderRegistration](#) Registers event consumer providers with WMI. [\\_\\_EventDroppedEvent](#) Represents the occurrence of an event that is dropped. A dropped event is an event that is not delivered to an event consumer. [\\_\\_EventFilter](#) Registration of a permanent event consumer requires an instance of the [\\_\\_EventFilter](#) system class. [\\_\\_EventGenerator](#) Serves as a parent class for classes that control the generation of events, such as [timer events](#). [\\_\\_EventProviderCacheControl](#) Controls when an event provider is unloaded. [\\_\\_EventProviderRegistration](#) Registers event providers with WMI. [\\_\\_EventQueueOverflowEvent](#) Reports when an event is dropped as a result of delivery queue overflow. [\\_\\_EventSinkCacheControl](#) Used to determine when WMI releases an event consumer provider's [IWbemUnboundObjectSink](#) pointer. [\\_\\_ExtendedStatus](#) Used to report detailed status and error information. [\\_\\_ExtrinsicEvent](#) Serves as a parent class for all user-defined event types, also known as [extrinsic events](#). [\\_\\_FilterToConsumerBinding](#) Used in the registration of permanent event consumers to relate an instance of the of [\\_\\_EventConsumer](#) to an instance of [\\_\\_EventFilter](#). [\\_\\_IndicationRelated](#) Serves as a parent class for all event-related classes. [\\_\\_InstanceCreationEvent](#) Reports an instance creation event, which is a type of [intrinsic event](#) that is generated when a new instance is added to the namespace. [\\_\\_InstanceDeletionEvent](#) Reports an instance deletion event, which is a type of [intrinsic event](#) generated when an instance is deleted from the namespace. [\\_\\_InstanceModificationEvent](#) Reports an instance modification event, which is a type of [intrinsic event](#) generated when an instance changes in the namespace. [\\_\\_InstanceOperationEvent](#) Serves as a base class for all intrinsic events that relate to an instance. [\\_\\_InstanceProviderRegistration](#) Registers instance providers in WMI. [\\_\\_IntervalTimerInstruction](#) Generates events at intervals, similar to a [WM\\_TIMER](#) message in Windows programming. [\\_\\_MethodInvocationEvent](#) This class is not implemented. [\\_\\_MethodProviderRegistration](#) Registers method providers with WMI. [\\_\\_Namespace](#) Represents a WMI

namespace. [\\_\\_NamespaceCreationEvent](#) Reports a namespace creation event, which is a type of [intrinsic event](#) generated when a new namespace is added to the current namespace. [\\_\\_NamespaceDeletionEvent](#) Reports a namespace deletion event, which is a type of [intrinsic event](#) that is generated when a sub-namespace is removed from the current namespace. [\\_\\_NamespaceModificationEvent](#) Reports a namespace modification event, which is a type of [intrinsic event](#) that is generated when a namespace is modified. [\\_\\_NamespaceOperationEvent](#) A base class for all intrinsic events that relate to a namespace. [\\_\\_NotifyStatus](#) Serves as the parent class for provider-defined error classes. [\\_\\_NTLMUser9X](#) Controls remote access to a computer running unsupported versions of Windows. [\\_\\_ObjectProviderCacheControl](#) Controls when a class or instance provider is unloaded. [\\_\\_ObjectProviderRegistration](#) Serves as the parent for classes that are used to register class and instance providers in WMI. [\\_\\_PARAMETERS](#) Defines the input and output parameters for methods. [\\_\\_PropertyProviderCacheControl](#) Controls the cache when a property provider is unloaded. [\\_\\_PropertyProviderRegistration](#) Registers property providers in WMI. [\\_\\_Provider](#) Serves as the parent class for the [\\_\\_Win32Provider](#) system class. [\\_\\_ProviderHostQuotaConfiguration](#) Allows limits to be set on host process usage of system resources. [\\_\\_ProviderRegistration](#) Serves as the parent class for registration classes for various types of providers. [\\_\\_SecurityDescriptor](#) Represents a [security descriptor](#). [\\_\\_SecurityRelatedClass](#) Serves as a parent class for all types of security classes. [\\_\\_SystemClass](#) Base class from which most system classes derive. [\\_\\_SystemEvent](#) Represents a system event. [\\_\\_SystemSecurity](#) Contains methods that let you access and modify the security settings for a namespace. [\\_\\_thisNAMESPACE](#) Holds the security rights for the namespace in the form of a security descriptor. [\\_\\_TimerEvent](#) Reports an event generated by WMI in response to a consumer's request for an interval timer event or an absolute timer event. [\\_\\_TimerInstruction](#) Specifies instructions on how [timer events](#) should be generated for consumers. [\\_\\_TimerNextFiring](#) Reserved for operating system use. [\\_\\_Trustee](#) Represents a [trustee](#). Either a name or a SID (byte array) can be used. [\\_\\_Win32Provider](#) Registers information about a provider's physical implementation in WMI.
