

# Detection of Indicator Removal on Host, Detection Strategy

## DET0651

Archived: 2026-04-05 17:46:20 UTC

### AN1733

Mobile security products can detect which applications can request device administrator permissions. Application vetting services could look for use of APIs that could indicate the application is trying to hide activity. The user can view applications with administrator access through the device settings, and may also notice if user data is inexplicably missing. The user can see a list of applications that can use accessibility services in the device settings.
