Liege, the third biggest city in Belgium, has suffered today a ransomware attack that has disrupted the municipality's IT network and online services.

Following the attack, most of the city's civil status and population services are down, Liege officials said on a [status page](#) today.

Appointments for town halls, birth registration, wedding, and burial services have been canceled due to workers' inability to access the city's IT network.

Online forms for event permits and paid parking are also down, officials said.

"Other services are also affected," Liege officials added, promising to provide a more in-depth list later in the day to prevent locals from showing up at city courtners unnecessarily.

While officials only described the incident as a "computer attack," two Belgian [radio](#) and [TV stations](#) reported that the attack was the work of the Ryuk ransomware gang.

 Certains services et programmes de la Ville de Liège sont actuellement inaccessibles suite à une attaque informatique. C'est notamment le cas des mairies de quartier.

— Ville de Liège (@Villedeliege) [June 21, 2021](#)

The attack against the Liege municipality is not a rare occurrence. In fact, local city networks are often targeted by ransomware gangs because many cannot afford top-of-the-line security nor new IT gear, often running severely outdated servers and workstations with a small IT staff.

While Liege is a pretty big city, it is not the only major municipality that has fell victim to a ransomware attack in recent years.

The most recent attack hit [Tulsa](#), in the US, but prior to that, ransomware gangs also hit big US metro centers like [Hackney \(London\)](#), [Atlanta](#), [Baltimore](#), [Denver](#), [Knoxville](#), and [New Orleans](#).

The Liege ransomware attack also comes on the day that news leaked that the EU is considering creating a [joint rapid response force](#) to aid EU countries and cities to deal with cyber-attacks.
