

Protected User Data: Accounts, Sub-technique T1636.005 - Mobile

Archived: 2026-04-05 14:14:27 UTC

Adversaries may utilize standard operating system APIs to gather account data. On Android, this can be accomplished by using the AccountManager API. For example, adversaries may use the `getAccounts()` method to list all accounts.^[1] On iOS, this can be accomplished by using the Keychain services.

If the device has been jailbroken or rooted, adversaries may be able to access [Accounts](#) without the users' knowledge or approval.
