## Tool: QuiteRAT

Names	QuiteRAT Acres
Category	<a href="#">Malware</a>
Type	<a href="#">Backdoor</a>
Description	<p>(<a href="#">Talos</a>) QuiteRAT is a fairly simple remote access trojan (RAT). It consists of a compact set of statically linked Qt libraries along with some user-written code. The Qt framework is a platform for developing cross-platform applications. However, it is immensely popular for developing Graphical User Interface in applications. Although QuiteRAT, just like MagicRAT, uses embedded Qt libraries, none of these implants have a Graphical User Interface. .As seen with Lazarus Group’s MagicRAT malware, the use of Qt increases the code complexity, making human analysis harder. Using Qt also makes machine learning and heuristic analysis detection less reliable, since Qt is rarely used in malware development.</p> <p>Based on QuiteRAT’s technical characteristics, including the usage of the Qt framework, we assess that this implant belongs to the previously disclosed MagicRAT family. QuiteRAT was briefly discussed in WithSecure’s report from early 2023. The new campaign we’re disclosing exploited a ManageEngine ServiceDesk vulnerability (CVE-2022-47966) — which has a Kenna risk score of 100 out of 100 — to deploy QuiteRAT.</p>
