A *file object* provides a representation of a resource (either a physical device or a resource located on a physical device) that can be managed by the I/O system. Like other objects, they enable sharing of the resource, they have names, they are protected by object-based security, and they support synchronization. The I/O system also enables reading from or writing to the resource.

In this section

Topic	Description
About File Management	Information about file management.
Using File Management	Samples that use the file management functions.
File Management Reference	Elements used in file management.
