

Nimar Loader

By Joshua Platt

Published: 2021-03-01 · Archived: 2026-04-06 00:59:03 UTC

Baza (BazarLoader & BazarBackdoor) has been attributed to the organized cybercrime group behind Trickbot by multiple security vendors over the past year. Initially appearing around April of 2020, the malware was spread in email campaigns utilizing infrastructure previously used to distribute Trickbot. [1] The term BazarLoader was coined due to the reliance and use of Blockchain-DNS and the associated bazar domains used to communicate with the controllers. Since then, the terms Baza or Bazarloader have been used interchangeably to reference this particular malware family.

After the initial appearance of Baza, multiple reports attributing various code to the malware family appeared. [2] [3] It became increasingly obvious that development was on going and multiple projects were under construction. The downside to such a public following, is the common acceptance of activity based on previous TTPS. Combining TTPs such as loading powershell stagers into red team utilities along with similar campaign structures and C2 traffic patterns, can quickly lead to incorrect attribution of malware families and actors.

On Feb 3, we detected campaigns previously attributed to Baza but the malware utilized request headers that were different. Several others noticed oddities as well.[4][5] Further analysis indicated something completely different and new. Nimar loader did not share the same codebase as the baza family.

NimarLoader or Nimrod recently mistaken as BazarLoader, is coded in Nim. The malware was obfuscated but did not contain the typical hardening seen in large scale campaigns. Since it was something newly developed, crypting the sample was unnecessary but it is curiously absent making analysis less difficult. From the strings, hints at the capability can be clearly seen.

```
verb in @["GET", "POST"]
@https
@fKHMP]
@SPMVDS
job_type
job_args
job_results
@heartbeat set
@HEARTBEAT set Failed
@HEARTBEAT set
@Shellcode Done
@heartbeat
@shellcode
@handshake
@No update data recieved
agentId
```

```
pathAdj  
pathNoun  
seqNum  
seqTotal  
jobIdHeader  
userAgent  
serverPubKeyEncoded  
jitterParamStr  
sessionKey  
sessionDie
```

The command table allows to handshake, heartbeat, shellcode, powershell or cmd, as evidenced in the strings seen during execution.

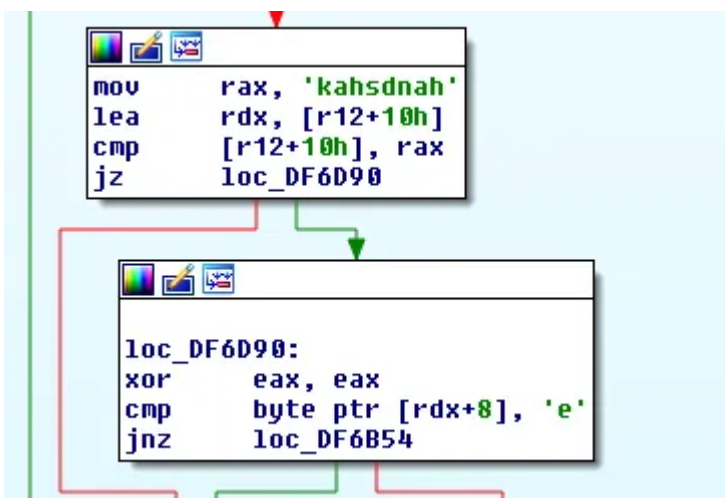

Image1: handshake

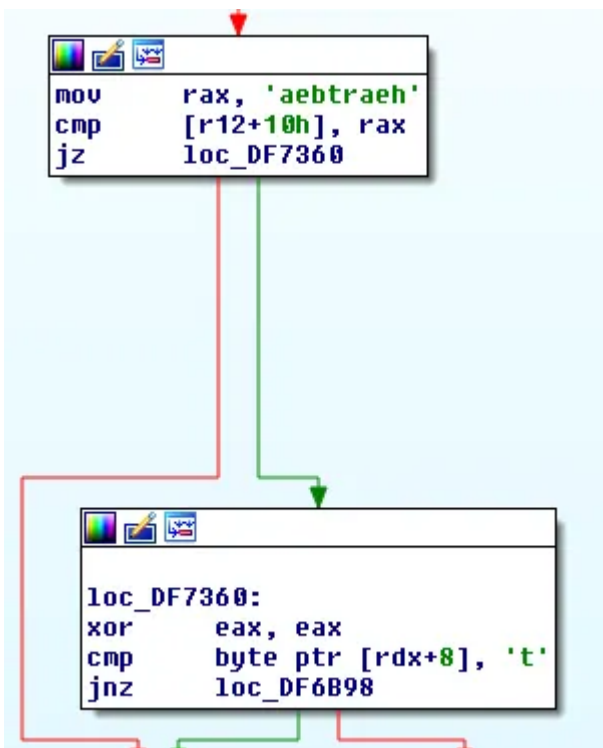

Image2: heartbeat

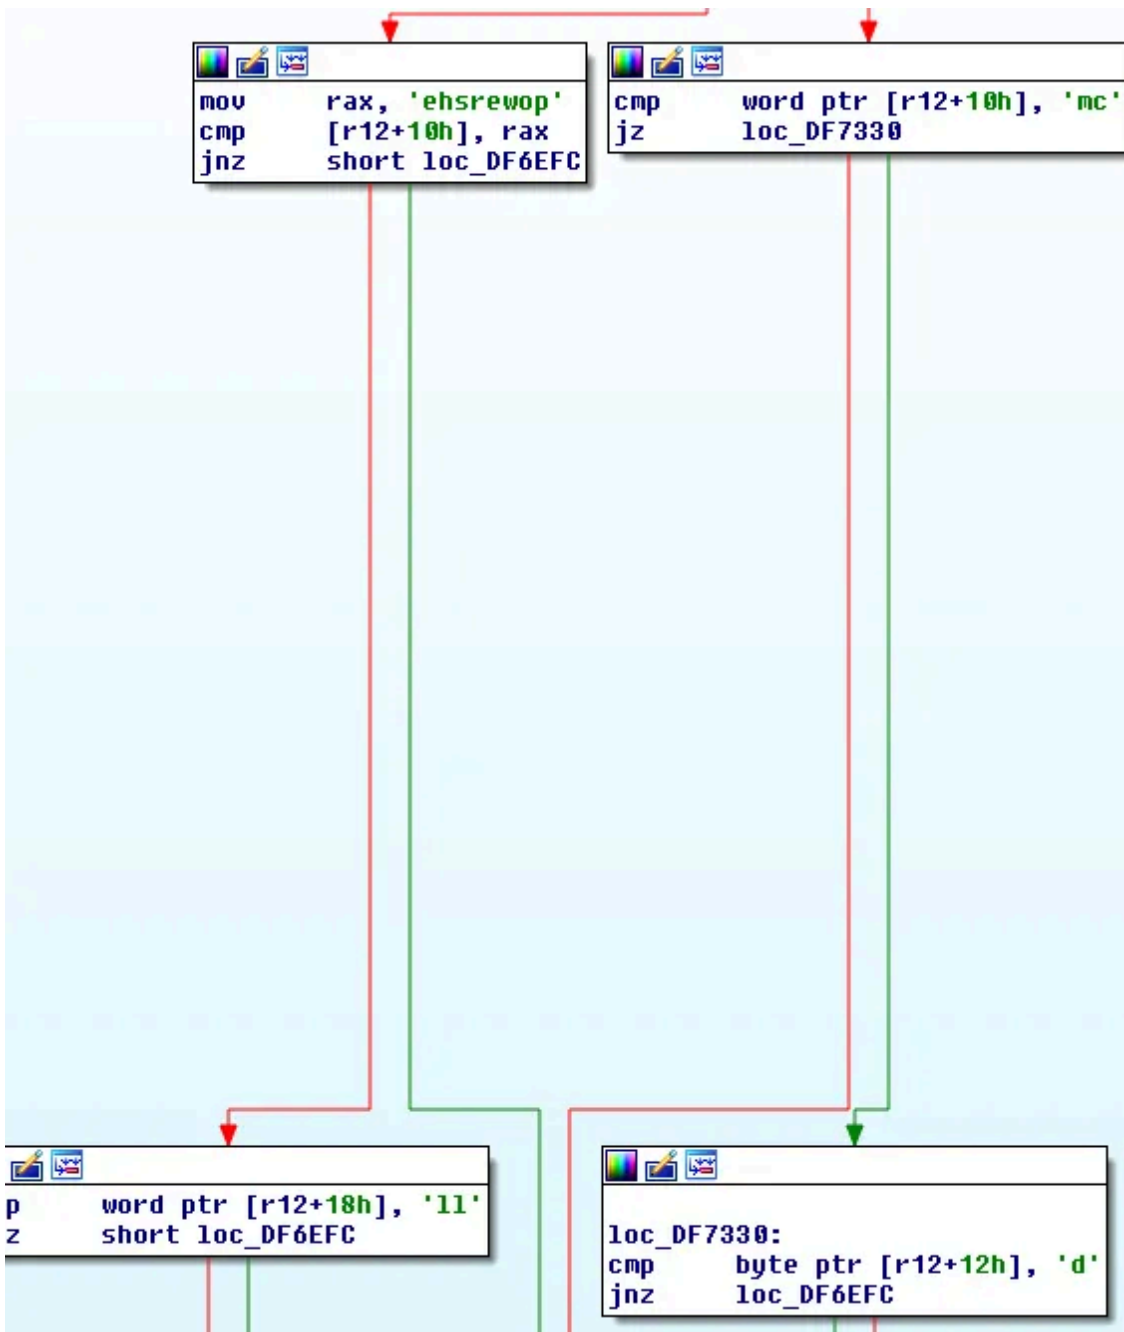

Image3. powershell or cmd

```
mov     rax, 'docllehs'  
cmp     [r12+10h], rax  
jz      loc_DF7348  
  
loc_DF7348:  
xor     eax, eax  
cmp     byte ptr [rdx+8], 'e'  
jnz     loc_DF6B76
```

Image4: shellcode

```
loc_DF6BA8:  
mov     rbx, 'dnammoc'  
mov     ecx, 2Ch  
call    sub_DC9DE0  
mov     edx, 15h  
mov     rcx, rax  
mov     [rbp+var_340], rax  
call    sub_DC8980  
xor     r8d, r8d  
mov     rcx, 'nwonknu'  
mov     [rbp+var_340], rax  
mov     rdx, [rax]  
lea     rdx, [rax+rdx+10h]  
mov     [rdx], rcx  
mov     ecx, 20h  
mov     [rdx+8], rbx  
mov     [rdx+14h], cx  
lea     rcx, [rbp+var_340]  
mov     dword ptr [rdx+10h], 'epyt'  
mov     rdx, r12  
add     qword ptr [rax], 15h  
call    sub_DF16C0  
mov     rcx, [rbp+var_340]  
xor     edx, edx
```

Image5: unknown command

While some of the strings are visible, a string encoding and decoding routine exists.

```
mov     [rsi+20h], rbx  
mov     edx, 67380BCCh  
lea     rcx, unk_E06A20  
call    DecodeString_DEDD10  
mov     rbx, rax
```

Image6: Decoding routine

The decoding loop XORs every byte of the encoded string with every byte of the key and then increments the key by one, due to how XOR works this is the same as XOR encoding every byte with a single XOR byte and

incrementing the key by the iterator in a rolling single byte XOR loop.

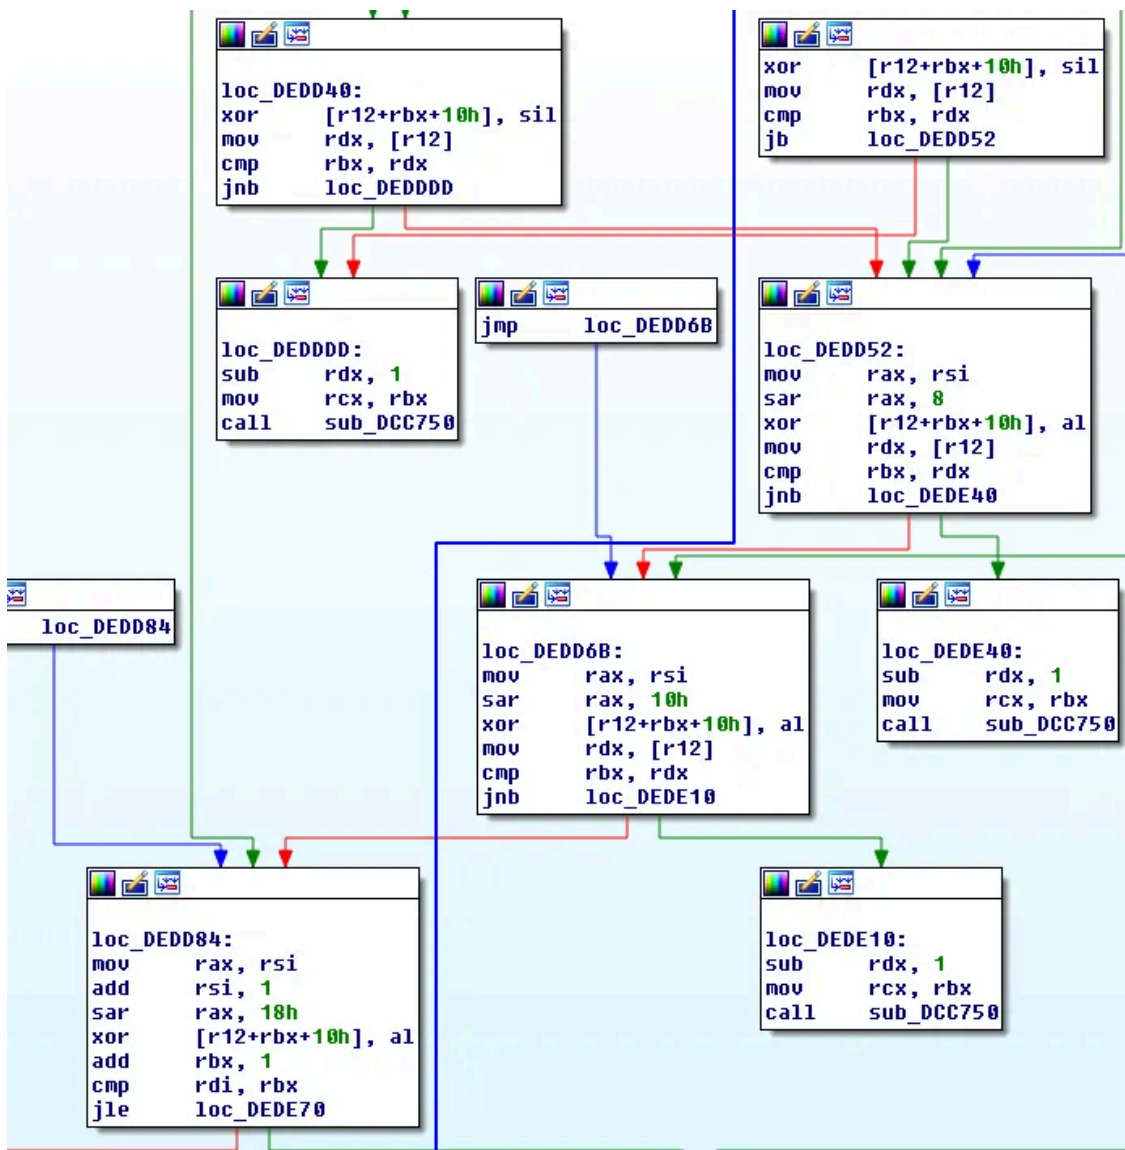

Image7: Decoding Loop

After running the routine the following strings are decrypted:

As referenced earlier, the sample functions a bit like a loader, with the ability to process shellcode and execute tasks or jobs via cmd or powershell. Similar to the majority of Baza campaigns, the tasks that were executed came in the form of cobalt strike stagers. The benefit of using this “fileless” mechanism, is nothing touches disk.

Nearly identical infrastructure has been positively associated with the deployment of not only BazarLoader but with the deployment of RYUK by Mandiant last October. [6]

Nimar Loader appears to be partially based on existing code or perhaps the idea originated elsewhere. The actors behind TrickBot have incorporated free utilities and software developed by the CyberSecurity or opensource communities for their own nefarious purposes (MiniLZO, BloodHound, CobaltStrike, PowerSploit, Obfuscator-LLVM, ADVobfuscator...) in the past. While the nim language is not new to the offensive scene, it is quite a departure for the traditional tooling of Trickbot. [7]
