

# GitHub - Mr-Un1k0d3r/ThunderShell: Python / C# Unmanaged PowerShell based RAT

By L1ghtn1ng

Archived: 2026-04-05 21:15:29 UTC

ThunderShell is a C# RAT that communicates via HTTP requests. All the network traffic is encrypted using a second layer of RC4 to avoid SSL interception and defeat network detection on the target system. RC4 is a weak cipher and is used to help obfuscate the traffic. HTTPS options should be used to provide integrity and strong encryption.

Information on how to use the tool and it's supported features is located on the [Wiki](#).

## Current beta version

Current release is 3.1.2
