AES encryption data

We can see that the malware has possible CnC traffic, and that malware is capable of performing AES encryption.

## Basic Dynamic Analysis

For basic dynamic analysis, the malware was already run in app.any.run, so i observed the data from there.

Any run sandbox data

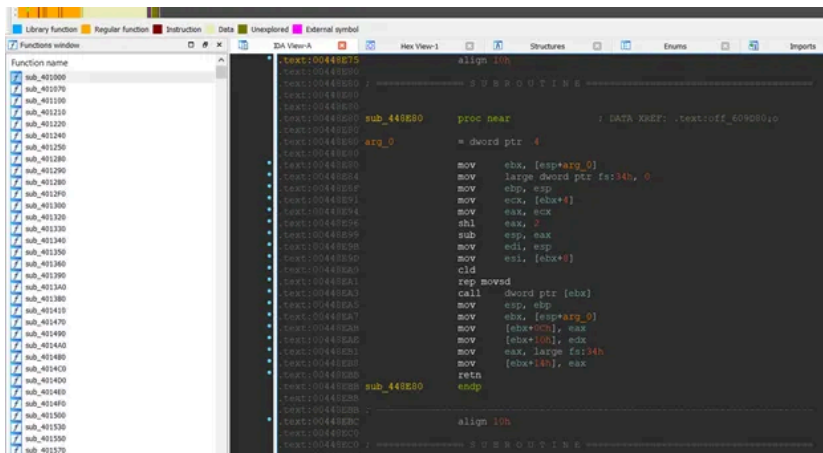

The malware is touted as malicious, but i do not see any network connection. So I ran the malware in a VM, the malware encrypted most of the data, but i could not file any help text, as to how to recover them.

Running in VM.

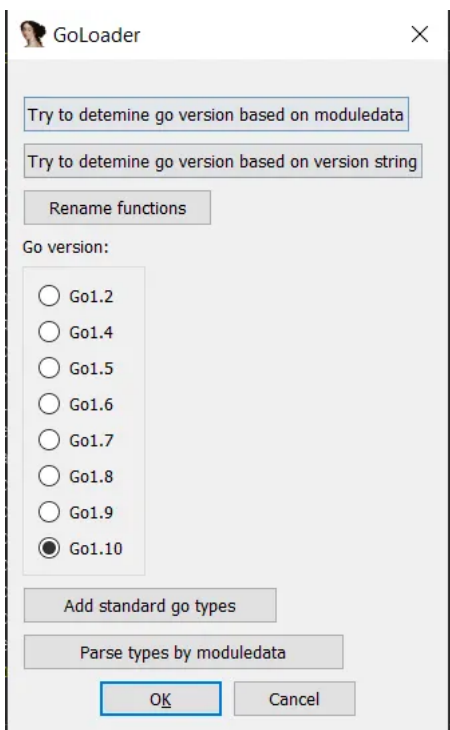

## Code Reversing

Unlike regular golang binaries, there were no regular function names. The malware author has thus attempted to obfuscate the various function names.

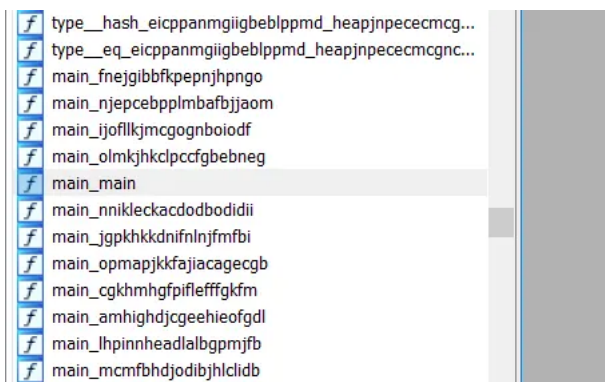

Code Obfuscation

So in order to de-obfuscate the function names a tool called idagolang helper was used <https://github.com/sibears/IDAGolangHelper>.

Using IDA Golang Helper tool

Now we getting somewhere, there are a lot of golang builtin functions that we can see. But looking at function name, I was trying to get a hint of the purpose the various main functions , but the function names itself is weird and was most likely obfuscated/randomized to slow down reversing process.

Golang built in functions renamed, but main names are garbage

So I started analyzing the main functions, eventually it led me to the syscall function call from the golangs built in function.

```
sub esp, 28h
mov eax, [esp+28h+arg_0]
mov [esp+28h+var_28], eax
mov eax, [esp+28h+arg_4]
mov [esp+28h+var_24], eax
call syscall_StringToUTF16Ptr
mov eax, [esp+28h+var_20]
mov [esp+28h+var_4], eax
lea ecx, stru_5C9400
mov [esp+28h+var_28], ecx
call runtime_newobject
mov edi, [esp+28h+var_24]
mov [esp+28h+var_8], edi
lea esi, dword_699640
call loc_448AC2
mov eax, [esp+28h+var_4]
mov ecx, [esp+28h+var_8]
mov [ecx+8], eax
mov eax, dword_78D214
mov [esp+28h+var_28], eax
mov [esp+28h+var_24], ecx
mov [esp+28h+var_20], 3
mov [esp+28h+var_1C], 3
call syscall_ptr_LazyProc_Call ; syscall_ptr_LazyProc_Call
mov eax, [esp+28h+var_10]
mov ecx, [esp+28h+var_C]
mov edx, [esp+28h+var_18]
```

syscall

So after referring to the golangs documentatation at <https://golang.org/pkg/syscall/?GOOS=windows>, it seemed that it was used to call a function from a windows dll file. Here's a snippet.

```
type LazyProc

A LazyProc implements access to a procedure inside a LazyDLL. It delays the lookup until the Addr, Call, or Find method is called.

type LazyProc struct {
    Name string
    // contains filtered or unexported fields
}

func (*LazyProc) Addr

Addr returns the address of the procedure represented by p. The return value can be passed to Syscall to run the procedure.

func (*LazyProc) Call

func (p *LazyProc) Call(a ...uintptr) (r1, r2 uintptr, lastErr error)

Call executes procedure p with arguments a. See the documentation of Proc.Call for more information.
```

Golang documentation

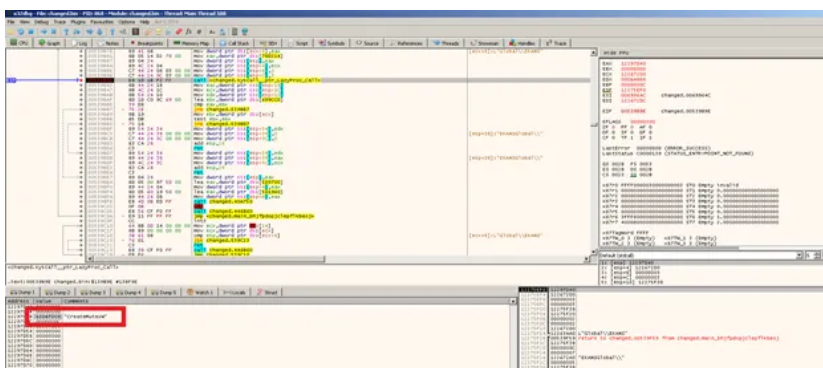

I could not determine the exact function being called via static analysis, so had to run the sample inside a debugger.

Remember me for faster sign in

It seems the function that was being called is CreateMutexW.

CreateMutexW

```

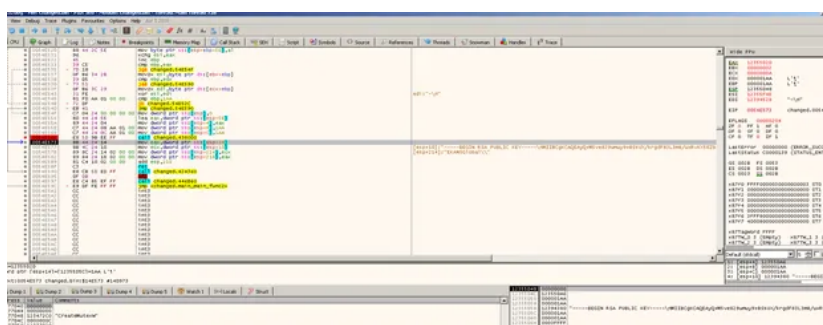

mov     dword ptr [esp+0Ch], 3
call   syscall_ptr_LazyProc_Call ; syscall_ptr LazyProc_Call
mov     eax, [esp+18h] ; probably Error returned
mov     ecx, [esp+1Ch] ; returned pointer
mov     edx, [esp+10h] ; returned pointer
lea     ebx, off_699CC0
cmp     eax, ebx
jnz    short loc_539BE7

loc_539BD7:
mov     ebx, [ecx]
test    ebx, ebx
jnz    short loc_539BD7

loc_539BE7:
mov     [esp+28h+var_28], eax
lea     eax, syscall_Errno
mov     [esp+28h+var_24], eax
lea     eax, error
mov     [esp+28h+var_20], eax
call   runtime_panicdottypeI
    
```

By observing that the value esp+0x18 being used in error condition check we can assume that it is the lastErr value and the rest is the returned pointer. Seeing this we can safely assume, that the function main\_bhjfpdopjclepflkbeoj is responsible for calling the windows function CreateMutexW and returning its value. Renaming the function to syscall\_function. Renamed main\_ienocpmdijcihngapkhe to calls\_function\_Creating\_global\_and\_syscall\_create\_mutex.

Continuing further analysis, the function at 0054E480 was responsible for key extraction.

Key extraction

I did not see network communication for getting key, and after running the malware multiple times, the key seems to be the same “ — — -BEGIN RSA PUBLIC KEY — — -  
 \nMIIBCgKCAQEAyQ+M5ve829umuy9+BSsUX/krgdF83L3m8/uxRvKX5EZbSh1+buON\nZYr5MjfhrdiOGnrbB1j0Fy31U/uzvWcy7VvK/zcsO/5aAh  
 — — -END RSA PUBLIC KEY — — -\n”.

After indepth analysis, it seems function with name pattern main\_ffhlhdmhalodcojcaeok\_\*\*\* seems to be junk function, because the function just converts slice of byte to string or vice versa, and the value is not useful at all.

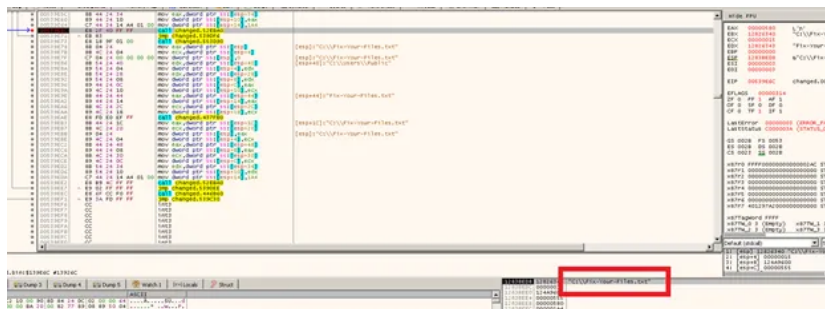

Digging further, function sub\_0053A060 is responsible for looping through each files and encrypting them and finally the function main\_amgmhoegchpnnaljano 00539C30 eventually calls io\_ioutil\_WriteFile. I thought it could be possibly help file, so i debugged it and trying to find what it actually wrote.

```

:mcfb,  mov     ecx, [esp+80h+var_60]
:mcfb,  mov     [esp+80h+var_80], eax
:mcfb,  mov     [esp+80h+var_7C], ecx
:mcfb,  mov     eax, [esp+80h+var_38]
:mcfb,  mov     [esp+80h+var_78], eax
:mcfb,  mov     eax, [esp+80h+var_50]
:mcfb,  mov     [esp+80h+var_74], eax
:mcfb,  mov     eax, [esp+80h+var_4C]
:mcfb,  mov     [esp+80h+var_70], eax
:mcfb,  mov     [esp+80h+var_6C], 1A4h
:ncec,  call   io_ioutil_WriteFile
:ecetr, jmp     short loc_539DF6

loc_539DF6:
    
```

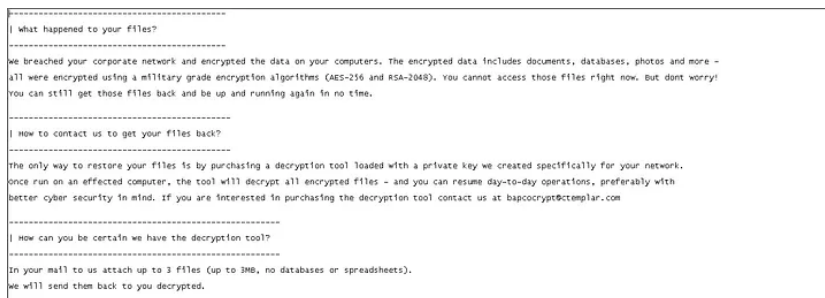

Static Analysis

### Debugging

The file is at C:\Fix-Your-Files.txt. but I could not find the file. The ransomware seems to have failed to write the file. So I thought may be it needed admin privileges to write the help file. I ran the sample again with admin privileges, and now it has written the file.

Press enter or click to view image in full size

### Help Message

This just seems extremely odd. I do not understand why the author chose to write the help file in such a specific location where the user had to search for it. Other ransomwares seem to have changed the wallpaper itself, or drop the help file in each file. It just seems like a bad choice to keep the help file in a specific location where to write admin privileges was required.

Yara rule for this ransomware:

```
rule SnakeRansomware{meta:Author = "Nishan Maharjan"Description = "A yara rule to catch snake ransomware"Data
```
