## Tool: IGT supertool

Names	IGT supertool Information Gathering Tool
Category	<a href="#">Malware</a>
Type	<a href="#">Reconnaissance</a> , <a href="#">Credential stealer</a>
Description	<p>(<a href="#">Kaspersky</a>) A noteworthy addition to the Poseidon toolkit is the IGT supertool (Information Gathering toolkit), a bulking 15 megabyte executable that orchestrates a series of different information collections steps, exfiltration, and the cleanup of components. This tool appears to be designed to operate on high-value corporate systems like Domain Controllers or IIS servers that act as repositories of valuable information, particularly for lateral movement. The Information Gathering Tool (IGT) tool is coded in Delphi and includes powershell and SQL components across a dozen different drops. This tool contains several other executable files made in different programming languages ranging from Visual Basic 6 to C#, each one performing a very clear task devised by the group when trying to obtain more information from an objective. The main purpose of the IGT tool is to make an inventory of the system, saving information from the network interfaces and addresses, credentials belonging to the Domain and database server, services being run from the OS and everything that could help the Poseidon Group make its attack more customized to its victim.</p>
