Modification(s) from previous version

- Complete rewrite

Security Requirements

None for normal use. -full option requires admin rights.

Language

C++. Compiled with Borland Builder 6.0

Source Code Availability

None

Story

This is a little app that I wrote up after seeing a post in one of the microsoft.public.* newsgroups. The question involved how to delegate the ability to do net sessions. While I was unsure of how to do that w/o adding someone to one of the builtin groups I noticed that the netsessionenum API call had various levels of info and you could get to quite a bit of info w/o actually have enhanced privileges - in fact you can get this information through a null session i.e. anonymously....

There are two levels of info you can get with this tool. The normal level and -full which will allow an admin to pull the more in depth info as well.

Download

You do not have to supply the email address. I would like you to fill that in though so that I have an idea on how popular a tool really is. If I see 1000 downloads with 900 different email addresses I know it is more widespread than one that has 1000 downloads and 200 different email addresses because the same person needed to keep downloading it for some reason.

Version History

- Update: Version 1.01.00 - 10/12/2002 - Original Version publicly available.
 - Update: Version 2.00.00 - 02/01/2004 - Complete rewrite.
-

As seen in

- USENET newsgroup postings.
-

Usage

Download and type NetSess /?
