

# Havoc

Archived: 2026-04-05 18:45:06 UTC

## Welcome

## What is Havoc

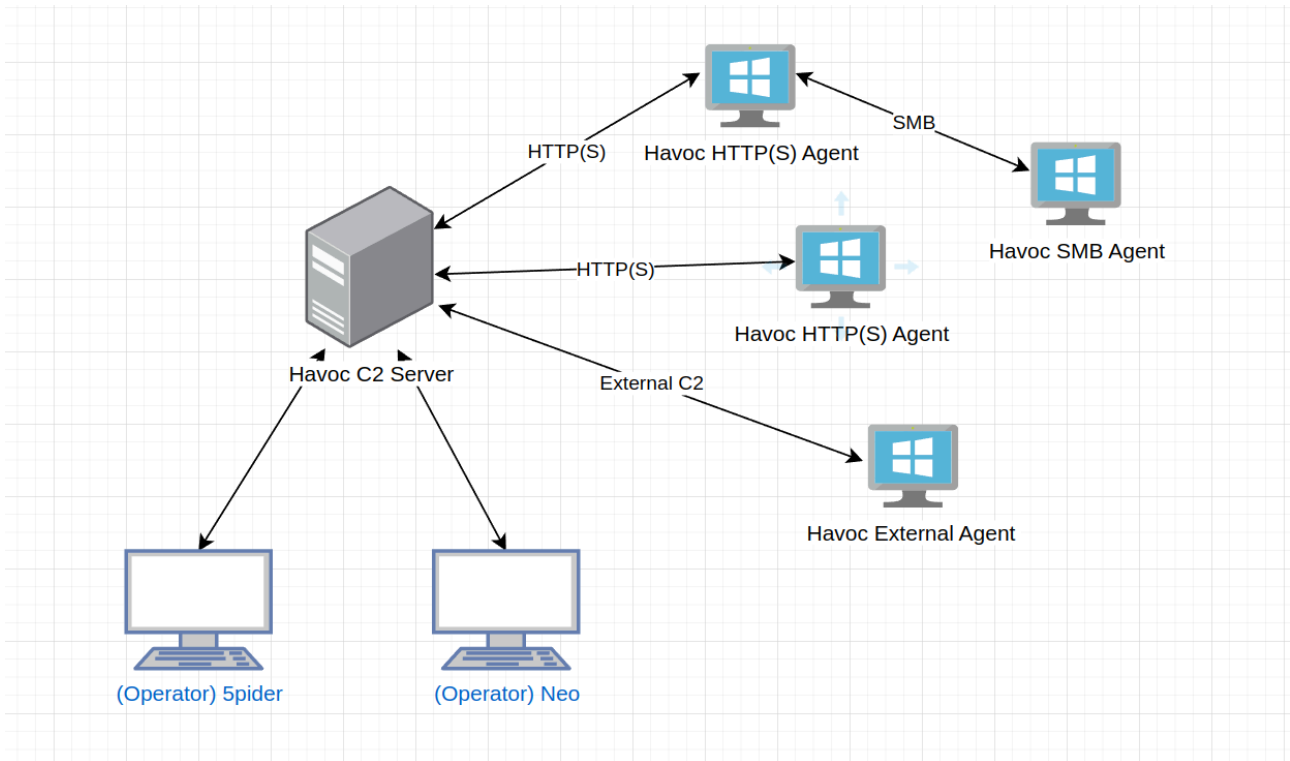

Havoc is a modern, malleable post-exploitation command and control framework made for penetration testers, red teams, and blue teams.

It's free and [open source on github](#) written and maintained by [Paul Ungur \(C5pider\)](#).

## How does Havoc work?

The Havoc Framework is split into 2 parts. The Teamserver handles connected operators, tasking agents and parsing the callback, listeners, and downloaded files and screenshots from the agents. It should run on a public VPS to be accessible by known and registered operators.

The Client is the user interface for the server. There you can interact, task agent's commands and receive output from them.

## How can I help?

Consider supporting this project by donating to the author [Paul Ungur \(C5pider\)](#):
